

## TPS2511 USB 专用充电端口控制器和限流电源开关

### 1 特性

- 支持将 D+ 线路短接至 D- 线路的 USB DCP
- 支持在 D+ 线路上应用 2V 电压而在 D- 线路上应用 2.7V 电压的 USB DCP（或在 D+ 线路上应用 2.7V 电压而在 D- 线路上应用 2V 电压的 USB DCP）
- 支持在 D+ 和 D- 线路上应用 1.2V 电压的 USB DCP
- 为所连接器件自动切换 D+ 和 D- 线路连接
- 针对输出短路保护的断续模式
- 具有用于 USB 线缆补偿的  $\overline{CS}$  引脚
- 可编程电流限值 (ILIM\_SET 引脚)
- 在 2.3A（典型值）时具有精确的  $\pm 10\%$  电流限制
- 70m $\Omega$ （典型值）高侧 MOSFET
- 兼容 USB 2.0 和 3.0 电源开关要求
- 工作电压范围：4.5V 至 5.5V
- 采用 8 引脚 MSOP-PowerPAD™ 封装

### 2 应用范围

- 车载 USB 电源充电器
- 具有 USB 端口的交流/直流适配器
- 其他 USB 充电器

### 3 说明

TPS2511 器件是 USB 专用充电端口 (DCP) 控制器和限流电源开关。它具有自动检测特性，可监控 USB 数据线路电压，并在数据线路上自动提供正确的电气特征，以便在下列专用充电方案中为器件兼容进行充电：

1. 分压器 DCP，需要分别在 D+ 和 D- 线路上应用 2.7V 和 2V 电压，或者分别在 D+ 和 D- 线路上应用 2V 和 2.7V 电压
2. BC1.2 DCP，需要将 D+ 线路短接至 D- 线路
3. D+ 和 D- 线路上的电压均为 1.2V

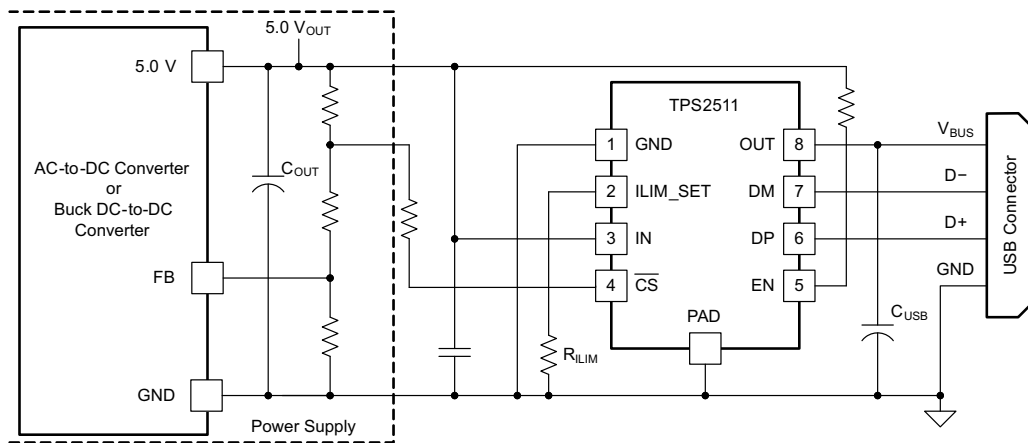

TPS2511 是一款 70m $\Omega$  配电开关，适用于可能出现大型容性负载和短路问题的应用。此器件还在输出 (OUT) 电压少于 3.8V（典型值）时或者在过载情况下发生过热保护时提供打嗝模式。精准且可编程的电流限值为应用提供了灵活性和便利性。TPS2511 提供一个  $\overline{CS}$  引脚来进行 USB 线缆电阻补偿和一个 EN 引脚来控制器件的导通和关断。

器件信息(1)

器件型号	封装	封装尺寸 (标称值)
TPS2511	MSOP-PowerPAD (8)	3.00mm x 3.00mm

(1) 如需了解所有可用封装，请参阅产品说明书末尾的可订购产品附录。

## 5 Pin Configuration and Functions

### Pin Functions

PIN		TYPE <sup>(1)</sup>	DESCRIPTION
NAME	NO.		
$\overline{CS}$	4	O	Active-low, open-drain output. When OUT current is more than approximately half of the current limit set by a resistor on ILIM_SET pin, the output is active low. Maximum sink current is 10 mA.
DM	7	I/O	Connected to the D– or D+ line of USB connector. Provide the correct voltage with an attached portable equipment for DCP detection, high impedance while disabled.
DP	6	I/O	Connected to the D+ or D– line of USB connector. Provide the correct voltage with an attached portable equipment for DCP detection, high impedance while disabled.
EN	5	I	Logic-level control input. When it is high, turns power switch on, when it is low, turns power switch off and turns DP and DM into the high impedance state.
GND	1	G	Ground connection.
ILIM_SET	2	I	External resistor used to set current limiting Threshold. TI recommends $16.9\text{ k}\Omega \leq R_{ILIM\_SET} \leq 750\text{ k}\Omega$ .
IN	3	P	Power supply input voltage connected to the power switch. Connect a ceramic capacitor with a value of 0.1- $\mu\text{F}$ or greater from the IN pin to GND as close to the device as possible.
OUT	8	O	Power-switch output. Connect to VBUS of USB
PowerPAD	PowerPAD	G	Ground connection.

(1) G = Ground, I = Input, O = Output, P = Power

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
Voltage	IN	Supply voltage	-0.3	7	V
	EN, ILIM_SET	Input voltage	-0.3	7	
	OUT, $\overline{\text{CS}}$		-0.3	7	
	IN to OUT		-7	7	
	DP output voltage	DM output	-0.3	IN+0.3 or 5.7	
	DP input voltage	DM input	-0.3	IN+0.3 or 5.7	
Current	DP input current, DM input current	Continuous output sink current		35	mA
	DP output current, DM output current	Continuous output source current		35	
	$\overline{\text{CS}}$	Continuous output sink current		10	
	ILIM_SET	Continuous output source current		Internally limited	
Temperature	Operating junction temperature, $T_J$		Internally limited		
	Storage temperature, $T_{stg}$		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	All pins except 6 and 7	±2000	V
		Pins 6 and 7	±7500	
	Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>		±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

voltages are referenced to GND (unless otherwise noted), positive current are into pins.

			MIN	MAX	UNIT
$V_{IN}$	Input voltage of IN		4.5	5.5	V
$V_{\overline{\text{CS}}}$	Input voltage of $\overline{\text{CS}}$		0	5.5	
$V_{EN}$	Input voltage of EN		0	5.5	
$V_{DP}$	DP data line input voltage		0	5.5	
$V_{DM}$	DM data line input voltage		0	5.5	
$I_{DP}$	Continuous sink/source current			±10	mA
$I_{DM}$	Continuous sink/source current			±10	
$I_{\overline{\text{CS}}}$	Continuous sink current			2	
$I_{OUT}$	Continuous output current of OUT			2.2	A
$R_{ILIM\_SET}$	A resistor of current limit, ILIM_SET to GND		16.9	750	kΩ
$T_J$	Operating junction temperature		-40	125	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS2511	
		DGN (MSOP-PowerPAD)	
		8 PINS	
			UNIT
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	65.2	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	53.3	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	36.9	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	3.9	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	36.6	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	13.4	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

Conditions are  $-40^{\circ}\text{C} \leq (T_J = T_A) \leq 125^{\circ}\text{C}$ ,  $4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ ,  $V_{EN} = V_{IN}$  and  $R_{ILIM\_SET} = 22.1\text{ k}\Omega$ . Positive current are into pins. Typical values are at  $25^{\circ}\text{C}$ . All voltages are with respect to GND (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SWITCH</b>						
R <sub>DS(on)</sub>	Static drain-source ON-state resistance	I <sub>OUT</sub> = 2 A		70	120	mΩ
		I <sub>OUT</sub> = 2 A, $-40^{\circ}\text{C} \leq (T_J = T_A) \leq 85^{\circ}\text{C}$		70	105	
		I <sub>OUT</sub> = 2 A, T <sub>J</sub> = T <sub>A</sub> = 25°C		70	84	
I <sub>REV</sub>	Reverse leakage current	V <sub>OUT</sub> = 5.5 V, V <sub>IN</sub> = V <sub>EN</sub> = 0 V		0.01	2	μA
<b>DISCHARGE</b>						
R <sub>DCHG</sub>	Discharge resistance	V <sub>OUT</sub> = 4 V	400	500	630	Ω
<b>CURRENT LIMIT</b>						
I <sub>OS</sub>	OUT short-circuit current limit	R <sub>ILIM_SET</sub> = 44.2 kΩ	1060	1160	1270	mA
		R <sub>ILIM_SET</sub> = 22.1 kΩ	2110	2300	2550	
		R <sub>ILIM_SET</sub> = 16.9 kΩ	2760	3025	3330	
<b>HICCUP MODE</b>						
V <sub>OUT_SHORT</sub>	OUT voltage threshold of going into hiccup mode	V <sub>IN</sub> = 5 V, R <sub>ILIM_SET</sub> = 210 kΩ	3.6	3.8	4.1	V
<b>UNDERVOLTAGE LOCKOUT</b>						
V <sub>UVLO</sub>	IN UVLO threshold voltage, rising		3.9	4.1	4.3	V
	Hysteresis <sup>(1)</sup>			100		mV
<b>SUPPLY CURRENT</b>						
I <sub>IN_OFF</sub>	Disabled, IN supply current	V <sub>EN</sub> = 0 V, V <sub>IN</sub> = 5.5 V, $-40^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$		0.1	2	μA
I <sub>IN_ON</sub>	Enabled, IN supply current	V <sub>EN</sub> = V <sub>IN</sub> , R <sub>ILIM_SET</sub> = 210 kΩ		180	230	
<b>THERMAL SHUTDOWN</b>						
	Temperature rising threshold <sup>(1)</sup>	Not in current limit		155		°C
		In current limit		135		
	Hysteresis <sup>(1)</sup>			10		
<b>OUT CURRENT DETECTION</b>						
I <sub>HCC_TH</sub>	Load detection current threshold, rising <sup>(1)</sup>	R <sub>ILIM_SET</sub> = 22.1 kΩ		1060		mA
		R <sub>ILIM_SET</sub> = 44.2 kΩ		560		
I <sub>HCC_TH_HYS</sub>	Load detection current Hysteresis <sup>(1)</sup>	R <sub>ILIM_SET</sub> = 22.1 kΩ		230		mA
		R <sub>ILIM_SET</sub> = 44.2 kΩ		120		
V <sub>CS</sub>	CS output active-low voltage <sup>(1)</sup>	I <sub>CS</sub> = 1 mA	0	80	140	mV

(1) Specified by design. Not production tested.

## Electrical Characteristics (continued)

Conditions are  $-40^{\circ}\text{C} \leq (T_J = T_A) \leq 125^{\circ}\text{C}$ ,  $4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ ,  $V_{EN} = V_{IN}$  and  $R_{ILIM\_SET} = 22.1\text{ k}\Omega$ . Positive current are into pins. Typical values are at  $25^{\circ}\text{C}$ . All voltages are with respect to GND (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>ENABLE INPUT (EN)</b>						
$V_{EN\_TRIP}$	EN threshold voltage, falling		0.9	1.1	1.65	V
$V_{EN\_TRIP\_HYS}$	Hysteresis		100	200	300	mV
$I_{EN}$	Leakage current	$V_{EN} = 0\text{ V}$ or $V_{EN} = 5.5\text{ V}$	-0.5		0.5	$\mu\text{A}$
<b>BC 1.2 DCP MODE (SHORT MODE)</b>						
$R_{DPM\_SHORT}$	DP and DM shorting resistance	$V_{DP} = 0.8\text{ V}$ , $I_{DM} = 1\text{ mA}$		125	200	$\Omega$
$R_{DCHG\_SHORT}$	Resistance between DP/DM and GND	$V_{DP} = 0.8\text{ V}$	400	700	1300	k $\Omega$
$V_{DPL\_TH\_DETACH}$	Voltage threshold on DP under which the device goes back to divider mode		310	330	350	mV
$V_{DPL\_TH\_DETACH\_HYS}$	Hysteresis			50 <sup>(1)</sup>		mV
<b>DIVIDER MODE</b>						
$V_{DP\_2.7V}$	DP output voltage	$V_{IN} = 5\text{ V}$	2.57	2.7	2.84	V
$V_{DM\_2.0V}$	DM output voltage	$V_{IN} = 5\text{ V}$	1.9	2	2.1	
$R_{DP\_PAD1}$	DP output impedance	$I_{DP} = -5\text{ }\mu\text{A}$	24	30	40	k $\Omega$
$R_{DM\_PAD1}$	DM output impedance	$I_{DM} = -5\text{ }\mu\text{A}$	24	30	40	
<b>1.2 V / 1.2 V MODE</b>						
$V_{DP\_1.2V}$	DP output voltage	$V_{IN} = 5\text{ V}$	1.12	1.2	1.28	V
$V_{DM\_1.2V}$	DM output voltage	$V_{IN} = 5\text{ V}$	1.12	1.2	1.28	V
$R_{DP\_PAD2}$	DP output impedance	$I_{DP} = -5\text{ }\mu\text{A}$	80	105	130	k $\Omega$
$R_{DM\_PAD2}$	DM output impedance	$I_{DM} = -5\text{ }\mu\text{A}$	80	105	130	k $\Omega$

## 6.6 Switching Characteristics

Conditions are  $-40^{\circ}\text{C} \leq (T_J = T_A) \leq 125^{\circ}\text{C}$ ,  $4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$ ,  $V_{EN} = V_{IN}$  and  $R_{ILIM\_SET} = 22.1\text{ k}\Omega$ . Positive current are into pins. Typical values are at  $25^{\circ}\text{C}$ . All voltages are with respect to GND (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SWITCH</b>						
$t_r$	OUT voltage rise time	$C_L = 1\text{ }\mu\text{F}$ , $R_L = 100\text{ }\Omega$ , $V_{IN} = 5\text{ V}$ see <a href="#">Figure 1</a> , <a href="#">Figure 3</a>		1	1.5	ms
$t_f$	OUT voltage fall time	$C_L = 1\text{ }\mu\text{F}$ , $R_L = 100\text{ }\Omega$ , $V_{IN} = 5\text{ V}$ see <a href="#">Figure 1</a> , <a href="#">Figure 3</a>	0.2	0.35	0.5	
<b>CURRENT LIMIT</b>						
$t_{IOS}$	Short circuit response time <sup>(1)</sup>	$V_{IN} = 5\text{ V}$ , $R_L = 50\text{ m}\Omega$ , 2 inches lead length, See <a href="#">Figure 4</a>		1.5		$\mu\text{s}$
<b>HICCUP MODE</b>						
$t_{OS\_DEG}$	ON-time of hiccup mode <sup>(1)</sup>	$V_{IN} = 5\text{ V}$ , $R_L = 0$		16		ms
$t_{SC\_TURN\_OFF}$	OFF-time of hiccup mode <sup>(1)</sup>	$V_{IN} = 5\text{ V}$ , $R_L = 0$		12		s
<b>OUT CURRENT DETECTION</b>						
$t_{CS\_EN}$	$\overline{CS}$ deglitch time during turning on <sup>(1)</sup>	$I_{CS} = 1\text{ mA}$		8		ms
<b>ENABLE INPUT (EN)</b>						
$t_{on}$	OUT voltage turnon time	$C_L = 1\text{ }\mu\text{F}$ , $R_L = 100\text{ }\Omega$ , see <a href="#">Figure 1</a> , <a href="#">Figure 2</a>		2.6	5	ms
$t_{off}$	OUT voltage turnoff time			1.7	3

## 7 Detailed Description

### 7.1 Overview

The following overview references various industry standards. TI always recommends consulting the latest standard to ensure the most recent and accurate information.

Rechargeable portable equipment requires an external power source to charge its batteries. USB ports are convenient locations for charging because of an available 5-V power source. Universally accepted standards are required to ensure host and client-side devices meet the power management requirements. Traditionally, USB host ports following the USB 2.0 Specification must provide at least 500 mA to downstream client-side devices. Because multiple USB devices can be attached to a single USB port through a bus-powered hub, it is the responsibility of the client-side device to negotiate the power allotment from the host to ensure the total current draw does not exceed 500 mA. The TPS2511 provides 100 mA of current to each USB device. Each USB device can subsequently request more current, which is granted in steps of 100 mA up 500 mA total. The host may grant or deny the request based on the available current.

Additionally, the success of the USB technology makes the micro-USB connector a popular choice for wall adapter cables. This allows a portable device to charge from both a wall adapter and USB port with only one connector.

One common difficulty has resulted from this. As USB charging has gained popularity, the 500-mA minimum defined by the USB 2.0 Specification or 900 mA defined in the USB 3.0 Specification, has become insufficient for many handsets, tablets, and personal media players (PMP), which have a higher-rated charging current. Wall adapters and car chargers can provide much more current than 500 mA or 900 mA to fast charge portable devices. Several new standards have been introduced defining protocol handshaking methods that allow host and client devices to acknowledge and draw additional current beyond the 500 mA (defined in the USB 2.0 Specification) or 900 mA (defined in the USB 3.0 Specification) minimum while using a single micro-USB input connector.

The TPS2511 supports three of the most common protocols:

- USB Battery Charging Specification, Revision 1.2 (BC1.2)
- Chinese Telecommunications Industry Standard YD/T 1591-2009
- Divider Mode

In these protocols there are three types of charging ports defined to provide different charging current to client-side devices. These charging ports are defined as:

- Standard downstream port (SDP)
- Charging downstream port (CDP)
- Dedicated charging port (DCP)

The BC1.2 Specification defines a charging port as a downstream facing USB port that provides power for charging portable equipment.

[Table 1](#) lists different port operating modes according to the BC1.2 Specification.

**Table 1. Operating Modes Table**

PORT TYPE	SUPPORTS USB 2.0 COMMUNICATION	MAXIMUM ALLOWABLE CURRENT DRAWN BY PORTABLE EQUIPMENT (A)
SDP (USB 2.0)	Yes	0.5
SDP (USB 3.0)	Yes	0.9
CDP	Yes	1.5
DCP	No	1.5

The BC1.2 Specification defines the protocol necessary to allow portable equipment to determine what type of port it is connected to so that it can allot its maximum allowable current drawn. The hand-shaking process is two steps. During step one, the primary detection, the portable equipment outputs a nominal 0.6-V output on its D+ line and reads the voltage input on its D– line. The portable device concludes it is connected to a SDP if the voltage is less than the nominal data detect voltage of 0.3 V. The portable device concludes that it is connected to a Charging Port if the D– voltage is greater than the nominal data detect voltage of 0.3 V and less than 0.8 V.

The second step, the secondary detection, is necessary for portable equipment to determine between a CDP and a DCP. The portable device outputs a nominal 0.6-V output on its D– line and reads the voltage input on its D+ line. The portable device concludes it is connected to a CDP if the data line being remains is less than the nominal data detect voltage of 0.3 V. The portable device concludes it is connected to a DCP if the data line being read is greater than the nominal data detect voltage of 0.3 V and less than 0.8 V.

## 7.3 Feature Description

### 7.3.1 Overcurrent Protection

During an overload condition, the TPS2511 maintains a constant output current and reduces the output voltage accordingly. If the output voltage falls to less than 3.8 V for 16 ms, the TPS2511 turns off the output for a period of 12 seconds as shown in Figure 10. This operation is referred to as hiccup mode. The device stays in hiccup mode (power cycling) until the overload condition is removed. Therefore the average output current is significantly reduced to greatly improve the thermal stress of the device while the OUT pin is shorted.

**Figure 10. OUT Pin Short-Circuit Current in Hiccup Mode**

Two possible overload conditions can occur. In the first condition, the output has been shorted before the device is enabled or before the voltage of IN has been applied. The TPS2511 senses the short and immediately switches into hiccup mode of constant-current limiting. In the second condition, a short or an overload occurs while the device is enabled. At the instant the overload occurs, high currents may flow for several microseconds before the current limit circuit can react. The device operates in constant-current mode for a period of 16 ms after the current limit circuit has responded, then switches into hiccup mode (power cycling).

## Feature Description (continued)

### 7.3.2 Current Limit Threshold

The TPS2511 has a current limiting threshold that is externally programmed with a resistor. Equation 1 and Figure 11 help determine the typical current limit threshold.

$$I_{OS\_TYP} = \frac{51228}{R_{ILIM}}$$

where

- $I_{OS\_TYP}$  is in mA and  $R_{ILIM}$  is in  $k\Omega$
  - $I_{OS\_TYP}$  has a better accuracy if  $R_{ILIM}$  is less than 210  $k\Omega$
- (1)

**Figure 11. Typical Current Limit vs Programming Resistor**

### 7.3.3 Current-Sensing Report ( $\overline{CS}$ )

The  $\overline{CS}$  open-drain output is asserted immediately when the OUT pin current is more than about half of the current limit set by a resistor on ILIM\_SET pin. Built-in hysteresis improves the ability to resist current noise on the OUT pin. The  $\overline{CS}$  output is active low. The recommended operating sink current is less than 2 mA and maximum sink current is 10 mA.

### 7.3.4 Undervoltage Lockout (UVLO) and Enable (EN)

The undervoltage lockout (UVLO) circuit disables the power switch and other functional circuits until the input voltage reaches the UVLO turnon threshold. Built-in hysteresis prevents unwanted oscillations on the output due to input voltage drop from large current surges.

The logic input of the EN pin disables all of the internal circuitry while maintaining the power switch off. A logic-high input on the EN pin enables the driver, control circuits, and power switch. The EN input voltage is compatible with both TTL and CMOS logic levels.

### 7.3.5 Soft Start, Reverse Blocking, and Discharge Output

The power MOSFET driver incorporates circuitry that controls the rise and fall times of the output voltage to limit large current and voltage surges on the input supply, and provides built-in soft-start functionality. The TPS2511 power switch blocks current from the OUT pin to the IN pin when turned off by the UVLO or disabled. The TPS2511 includes an output discharge function. A 500- $\Omega$  (typical) discharge resistor dissipates stored charge and leakage current on the OUT pin when the device is in UVLO or disabled. However as this circuit is biased from the IN pin, the output discharge is not active when the input approaches 0 V.

## Feature Description (continued)

### 7.3.6 Thermal Sense

The TPS2511 provides thermal protection from two independent thermal-sensing circuits that monitor the operating temperature of the power distribution switch and turnoff for 12 s (typical) if the temperature exceeds recommended operating conditions. The device operates in constant-current mode during an overcurrent condition and OUT pin voltage is greater than 3.8 V (typical), which has a relatively large voltage drop across power switch. The power dissipation in the package is proportional to the voltage drop across the power switch, so the junction temperature rises during the overcurrent condition. The first thermal sensor turns off the power switch when the die temperature exceeds 135°C and the device is within the current limit. The second thermal sensor turns off the power switch when the die temperature exceeds 155°C regardless of whether the power switch is in current limit. Hysteresis is built into both thermal sensors, and the switch turns on after the device has cooled approximately 10°C. The switch continues to cycle off and on until the fault is removed.

### 7.3.7 $V_{BUS}$ Voltage Drop Compensation

Figure 12 shows a USB charging design using the TPS2511. In general,  $V_{BUS}$  has some voltage loss due to USB cable resistance and TPS2511 power switch ON-state resistance. The sum of voltage loss is likely several hundred millivolts from  $5-V_{OUT}$  to  $V_{PD\_IN}$  that is the input voltage of PD while the high charging current charges the PD. For example, in Figure 13, assuming that the loss resistance is 170 mΩ (includes 100 mΩ of USB cable resistance and 70 mΩ of power switch resistance) and  $5 V_{OUT}$  is 5 V, the input voltage of PD ( $V_{PD\_IN}$ ) is about 4.66 V at 2 A (see Figure 13).

Copyright © 2016, Texas Instruments Incorporated

Figure 12. TPS2511 Charging System Schematic Diagram

The charging current of most portable devices is less than their maximum charging current while  $V_{PD\_IN}$  is less than the certain voltage value. Furthermore, actual charging current of PD decreases with input voltage falling. Therefore, a portable devices cannot accomplish a fast charge with its maximum charging rated current if  $V_{BUS}$  voltage drop across the power path is not compensated at the high charging current. The TPS2511 provides CS pin to report the high charging current for USB chargers to increase the  $5-V_{OUT}$  voltage. This is shown by the solid lines of Figure 13.

Feature Description (continued)

Figure 13. TPS2511  $\overline{CS}$  Function

Equation 2 through Equation 5 refer to Figure 12.

The power supply output voltage is calculated in Equation 2.

$$5V_{OUT} = \frac{(R_1 + R_2 + R_3) \times V_{FB}}{R_3} \tag{2}$$

5 V<sub>OUT</sub> and V<sub>FB</sub> are known. If R<sub>3</sub> is given and R<sub>1</sub> is fixed, R<sub>2</sub> can be calculated. The 5 V<sub>OUT</sub> voltage change with compensation is shown in Equation 3 and Equation 4.

$$\Delta V = \frac{(R_2 + R_3) \times R_1 \times V_{FB}}{R_3 \times R_4} \tag{3}$$

$$\Delta V = \left( \frac{5V_{OUT}}{V_{FB}} - \frac{R_1}{R_3} \right) \frac{R_1 \times V_{FB}}{R_4} \tag{4}$$

If R<sub>1</sub> is less than R<sub>3</sub>, then Equation 4 can be simplified as Equation 5.

$$\Delta V \approx \frac{5V_{OUT} \times R_1}{R_4} \tag{5}$$

7.3.8 Divide Mode Selection of 5-W and 10-W USB Chargers

The TPS2511 provides two types of connections between the DP pin and the DM pin and between the D+ data line and the D– data line of the USB connector for a 5-W USB charger and a 10-W USB charger with a single USB port. For a 5-W USB charger, the DP pin is connectd to the D– line and the DM pin is connected to the D+ line. This is shown in Figure 16 and Figure 17. It is necessary to apply DP and DM to D+ and D– of USB connector for 10-W USB chargers. See Figure 14 and Figure 15. Table 2 shows different charging schemes for both 5-W and 10-W USB charger solutions

Table 2. Charging Schemes for 5-W and 10-W USB Chargers

USB CHARGER TYPE	CONTAINING CHARGING SCHEMES		
5-W	Divider1	1.2 V on both D+ and D– Lines	BC1.2 DCP
10-W	Divider2	1.2 V on both D+ and D– Lines	BC1.2 DCP

Figure 16. 5-W USB Charger Application With Power Switch

Figure 17. 5-W USB Charger Application Without Power Switch

## 7.4 Device Functional Modes

### 7.4.1 Dedicated Charging Port (DCP)

A dedicated charging port (DCP) is a downstream port on a device that outputs power through a USB connector, but is not capable of enumerating a downstream device, which generally allows portable devices to fast charge at their maximum rated current. A USB charger is a device with a DCP, such as a wall adapter or car power adapter. A DCP is identified by the electrical characteristics of its data lines. The following DCP identification circuits are usually used to meet the handshaking detections of different portable devices.

#### 7.4.1.1 Short the D+ Line to the D– Line

The USB BC1.2 Specification and the Chinese Telecommunications Industry Standard YD/T 1591-2009 define that the D+ and D– data lines must be shorted together with a maximum series impedance of 200 Ω. This is shown in Figure 18.

**Device Functional Modes (continued)**

**Figure 18. DCP Short Mode**
**7.4.1.2 Divider1 (DCP Applying 2 V on D+ Line and 2.7 V on D– Line) or Divider2 (DCP Applying 2.7 V on D+ Line and 2 V on D– Line)**

There are two charging schemes for divider DCP. They are named after Divider1 and Divider2 DCPs that are shown in [Figure 19](#) and [Figure 20](#). The Divider1 charging scheme is used for 5-W adapters, Divider1 applies 2 V to the D+ line and 2.7 V to the D– data line. The Divider2 charging scheme is used for 10-W adapters and applies 2.7 V on the D+ line and 2 V is applied on the D– line.

**Figure 19. Divider1 DCP**

**Figure 20. Divider2 DCP**
**7.4.1.3 Applying 1.2 V to the D+ Line and 1.2 V to the D– Line**

As shown in [Figure 21](#), some tablet USB chargers require 1.2 V on the shorted data lines of the USB connector. The maximum resistance between the D+ line and the D– line is 200 Ω.

Device Functional Modes (continued)

Figure 21. DCP Applying 1.2 V to the D+ Line and 1.2 V to the D– Line

The TPS2511 is a combination of a current-limiting USB power switch and an USB DCP identification controller. Applications include vehicle power charger, wall adapters with USB DCP and other USB chargers. The TPS2511 DCP controller has the auto-detect feature that monitors the D+ and D– line voltages of the USB connector, providing the correct electrical characteristics on the DP and DM pins for the correct detections of compliant portable devices to fast charge. These portable devices include smart phones, 5-V tablets, and personal media players.

The TPS2511 power-distribution switch is intended for applications where heavy capacitive loads and short circuits are likely to be encountered, incorporating a 70-mΩ, N-channel MOSFET in a single package. This device provides hiccup mode when in current limit and OUT voltage is less than 3.8 V (typical) or an over-temperature protection occurs under an overload condition. Hiccup mode operation can reduce the output short-circuit current down to several milliamperes. The TPS2511 provides a logic-level enable EN pin to control the device turnon and turnoff and an open-drain output  $\overline{CS}$  for compensating  $V_{BUS}$  to account for cable  $I \times R$  voltage loss.

7.4.2 DCP Auto-Detect

The TPS2511 integrates an *auto-detect* feature to support divider mode, short mode and 1.2 V / 1.2 V mode. If a divider device is attached, 2.7 V is applied to the DP pin and 2 V is applied to the DM pin. If a BC1.2-compliant device is attached, the TPS2511 automatically switches into short mode. If a device compliant with the 1.2 V / 1.2 V charging scheme is attached, 1.2 V is applied on both the DP pin and the DM pin. The functional diagram of DCP auto-detect feature is shown in Figure 22.

Device Functional Modes (continued)

Figure 22. TPS2511 DCP Auto-Detect Functional Diagram

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS2511 is a USB-dedicated charging-port controller and power switch with cable compensation. It is typically used for wall adapter or power bank as a USB charging controller and overcurrent protector.

### 8.2 Typical Application

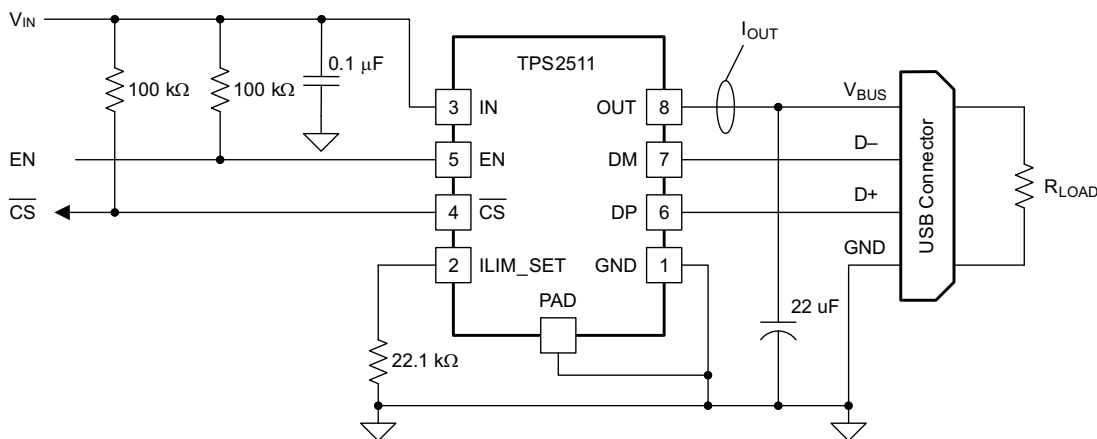

Figure 23. Test Circuit for System Operation

#### 8.2.1 Design Requirements

For this design example, request IOS; Minimum must exceed 2100 mA.

When choosing the power switch, TI recommends following these general steps:

1. Determine the voltage of the power rail, 3.3 V or 5 V, and then choose the operation range of power switch can cover power rail.
2. Determine the normal operation current; for example, the maximum allowable current drawn by portable equipment for USB 2.0 port is 500 mA, so the normal operation current is 500 mA and the minimum current limit of power switch must exceed 500 mA to avoid false trigger during normal operation.
3. Determine the maximum allowable current provided by up-stream power, and then decide the maximum current limit of power switch that must lower it to ensure power switch can protect the up-stream power when overload is encountered at the output of power switch.

### NOTE

Choosing power switch with tighter current limit tolerance can loosen the up-stream power supply design.

#### 8.2.2 Detailed Design Procedure

The user-programmable  $R_{ILIM}$  resistor on the ILIMIT\_SET pin sets the current limit. The TPS2511 uses an internal regulation loop to provide a regulated voltage on the ILIM\_SET pin. The current limiting threshold is proportional to the current sourced out of the ILIM\_SET pin. The recommended 1% resistor range for  $R_{ILIM}$  is from 16.9 kΩ to 750 kΩ to ensure stability of the internal regulation loop, although not exceeding 210 kΩ results in a better accuracy. Many applications require that the minimum current limit remain above a certain current

## Typical Application (continued)

level or that the maximum current limit remain below a certain current level, so it is important to consider the tolerance of the overcurrent threshold when selecting a value for  $R_{ILIM}$ . Equation 6 and Equation 7 calculate the resulting overcurrent thresholds for a given external resistor value ( $R_{ILIM}$ ). The traces routing the  $R_{ILIM}$  resistor to the TPS2511 must be as short as possible to reduce parasitic effects on the current limit accuracy. The equations along with Figure 24 and Figure 25 can be used to estimate the minimum and maximum variation of the current limit threshold for a predefined resistor value. This variation disregards the inaccuracy of the resistor itself.

$$I_{OS\_MIN} = \frac{51228}{R_{ILIM}^{1.030}}$$

where

- $I_{OS\_MIN}$  is in mA
- $R_{ILIM}$  is in  $k\Omega$

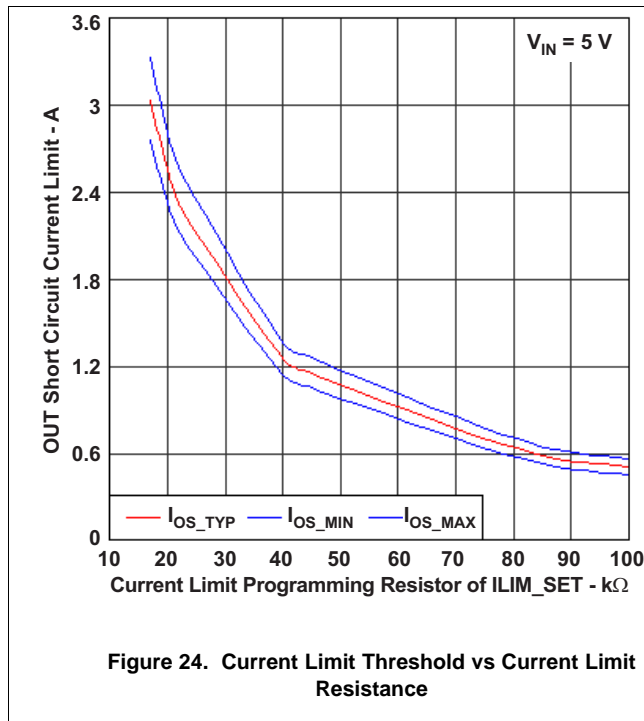

(6)

$$I_{OS\_MAX} = \frac{51228}{R_{ILIM}^{0.967}}$$

where

- $I_{OS\_MAX}$  is in mA
- $R_{ILIM}$  is in  $k\Omega$

(7)

For this example design, as shown in Equation 8,  $I_{OS\_MIN} = 2100$  mA.

$$I_{OS\_MIN} = \frac{51228}{R_{ILIM}^{1.03}} = 2100 \text{ mA}$$

(8)

$$R_{ILIM} = \left( \frac{51228}{I_{OS\_MIN}} \right)^{\frac{1}{1.03}} = \left( \frac{51228}{2100} \right)^{\frac{1}{1.03}} = 22.227 \text{ k}\Omega$$

(9)

### Typical Application (continued)

Including resistor tolerance, target nominal resistance value given by Equation 10.

$$R_{ILIM} = \frac{22.227 \text{ k}\Omega}{1.01 \text{ k}\Omega} = 22.007 \text{ k}\Omega \quad (10)$$

Choose Equation 11.

$$R_{ILIM} = 22 \text{ k}\Omega \quad (11)$$

#### 8.2.2.1 Input and Output Capacitance

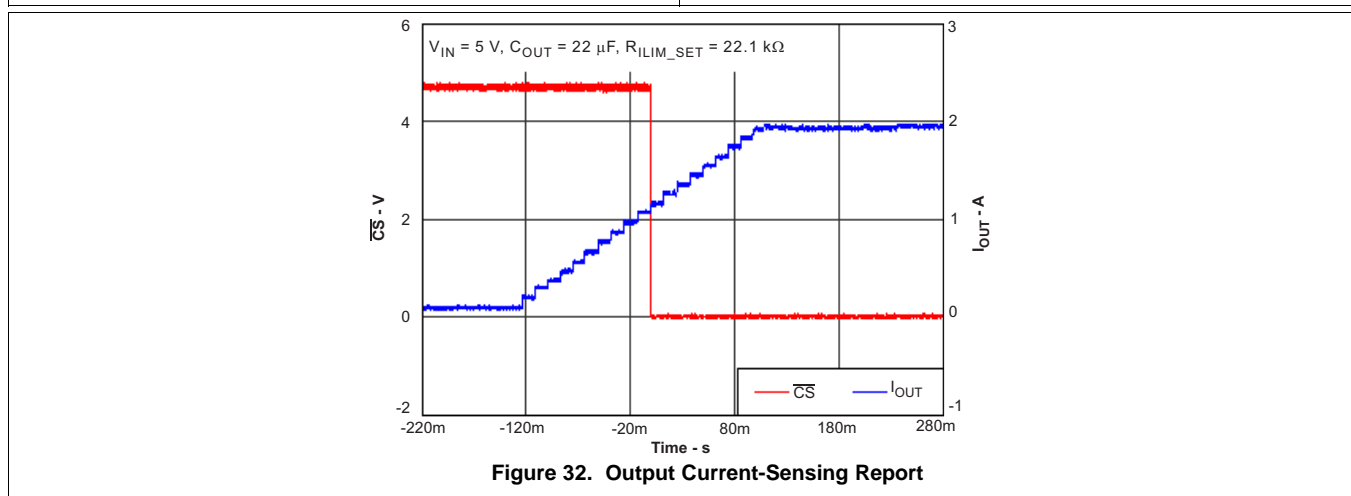

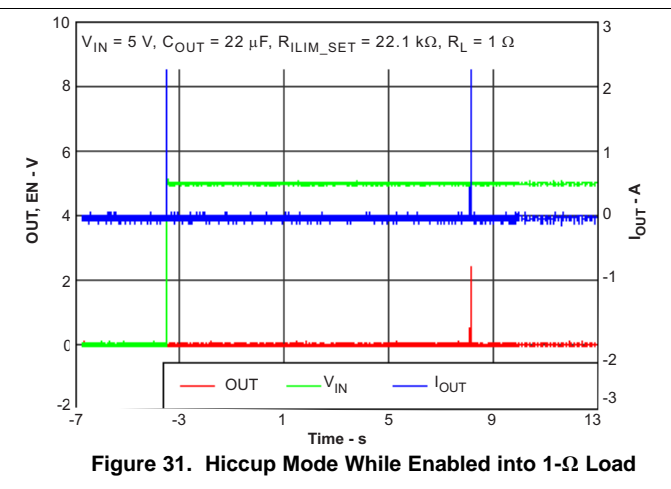

Input and output capacitance improves the performance of the device; the actual capacitance must be optimized for the particular application. For all applications, TI recommends placing a 0.1- $\mu\text{F}$  or greater ceramic bypass capacitor between IN and GND, as close to the device as possible for local noise decoupling. This precaution reduces ringing on the input due to power-supply transients. Additional input capacitance may be needed on the input to reduce voltage undershoot from exceeding the UVLO of other load share one power rail with TPS2511 or overshoot from exceeding the absolute-maximum voltage of the device during heavy transient conditions. This is especially important during bench testing when long, inductive cables are used to connect the evaluation board to the bench power supply.

TI recommends placing at least a 22- $\mu\text{F}$  ceramic capacitor or higher-value electrolytic capacitor on the output pin when large transient currents are expected on the output to reduce the undershoot, which is caused by the inductance of the output power bus just after a short has occurred and the TPS2511 has abruptly reduced OUT current. Energy stored in the inductance drives the OUT voltage down and potentially negative as it discharges.

#### 8.2.3 Application Curves

Typical Application (continued)

9 Power Supply Recommendations

Design of the devices is for operation from an input voltage supply range of 4.5 V to 5.5 V. The current capability of the power supply must exceed the maximum current limit of the power switch.

## 10 Layout

### 10.1 Layout Guidelines

- **TPS2511 placement.** Place the TPS2511 near the USB output connector and at least 22- $\mu$ F OUT pin filter capacitor. Connect the exposed PowerPAD to the GND pin and to the system ground plane using a via array.
- **IN pin bypass capacitance.** Place the 0.1- $\mu$ F bypass capacitor near the IN pin and make the connection using a low-inductance trace.
- **ILIM\_SET pin connection.** Current limit setpoint accuracy can be compromised by stray leakage from a higher voltage source to the ILIM\_SET pin. Ensure that there is adequate spacing between IN pin copper or trace and ILIM\_SET pin trace to prevent contaminant buildup during the PCB assembly process. The traces routing the  $R_{ILIM}$  resistor to the device must be as short as possible to reduce parasitic effects on the current limit accuracy.
- **DP and DM consideration.** Route these traces as differential micro-strips. For DP and DM, there is no internal IEC ESD cell, refer to application note [Effective System ESD Protection Guidelines:TPS251x USB Charging Port Controllers](#) for these 2 pins' IEC ESD design guideline.

### 10.2 Layout Example

For the trace routing of DP and DM, no strictly request must route these traces as micro-strips with nominal differential impedance of  $90\ \Omega$  because no USB 2.0 high-speed data transmission on these data line. But because there is no internal IEC ESD cell, TI recommends placing IEC ESD cell on DP and DM trace close to USB connector.

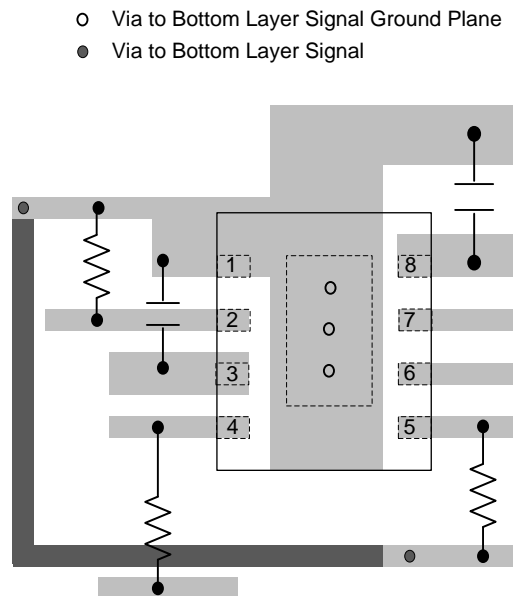

Figure 33. Layout Recommendation

## 12 机械、封装和可订购信息

以下页面包含机械、封装和可订购信息。这些信息是指定器件的最新可用数据。这些数据如有变更，恕不另行通知和修订此文档。如欲获取此数据表的浏览器版本，请参阅左侧的导航。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS2511DGN	ACTIVE	HVSSOP	DGN	8	80	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	2511	<a href="#">Samples</a>
TPS2511DGNR	ACTIVE	HVSSOP	DGN	8	2500	RoHS & Green	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	2511	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
