

TS5A23157-Q1 双通道 15Ω SPDT 模拟开关

1 特性

- 符合汽车应用要求
- 具有符合 AEC-Q100 标准的下列特性：
 - 器件温度等级 1：-40°C 至 125°C
 - 器件 HBM ESD 分类等级 H2
 - 器件 CDM ESD 分类等级 C4B
- 提供功能安全
 - 可帮助进行功能安全系统设计的文档
- 可支持客户特殊配置控制与重大变更批准
- 指定的先断后合开关
- 低导通电阻 (15Ω)
- 控制输入可承受 5V 电压
- 低电荷注入
- 出色的导通电阻匹配
- 低总计谐波失真
- 1.8V 至 5.5V 单电源运行

2 应用

- 采样保持电路
- 电池供电类设备
- 音频和视频信号路由
- 通信电路

3 描述

TS5A23157-Q1 是一款双通道单极双投 (SPDT) 模拟开关，其设计工作电压为 1.65V 至 5.5V。该器件可以同时处理数字和模拟信号，并可在任一方向传输高达 5.5V (峰值) 的信号。

有关最新的封装和订购信息，请参阅本文档结尾的“封装选项附录”，或访问 TI 网站：www.ti.com。

7 Parameter Description

| SYMBOL | DESCRIPTION |
|------------------|--|
| V_{COM} | Voltage at COM |
| V_{NC} | Voltage at NC |
| V_{NO} | Voltage at NO |
| r_{on} | Resistance between COM and NC or COM and NO ports when the channel is ON |
| Δr_{on} | Difference of r_{on} between channels |
| $r_{on(Flat)}$ | Difference between the maximum and minimum value of r_{on} in a channel over the specified range of conditions |
| $I_{NC(OFF)}$ | Leakage current measured at the NC port, with the corresponding channel (NC to COM) in the OFF state under worst-case input and output conditions |
| $I_{NO(OFF)}$ | Leakage current measured at the NO port, with the corresponding channel (NO to COM) in the OFF state under worst-case input and output conditions |
| $I_{NC(ON)}$ | Leakage current measured at the NC port, with the corresponding channel (NC to COM) in the ON state and the output (COM) being open |
| $I_{NO(ON)}$ | Leakage current measured at the NO port, with the corresponding channel (NO to COM) in the ON state and the output (COM) being open |
| $I_{COM(ON)}$ | Leakage current measured at the COM port, with the corresponding channel (NO to COM or NC to COM) in the ON state and the output (NC or NO) being open |
| V_{IH} | Minimum input voltage for logic high for the control input (IN) |
| V_{IL} | Minimum input voltage for logic low for the control input (IN) |
| V_{IN} | Voltage at IN |
| I_{IH}, I_{IL} | Leakage current measured at IN |
| t_{ON} | Turnon time for the switch. Measure this parameter under the specified range of conditions and by the propagation delay between the digital control (IN) signal and analog output (COM/NC/NO) signal when the switch is turning ON. |
| t_{OFF} | Turnoff time for the switch. Measure this parameter under the specified range of conditions and by the propagation delay between the digital control (IN) signal and analog output (COM/NC/NO) signal when the switch is turning OFF. |
| t_{BBM} | Break-before-make time. Measure this parameter under the specified range of conditions and by the propagation delay between the output of two adjacent analog channels (NC and NO) when the control signal changes state. |
| Q_C | Charge injection is a measurement of unwanted signal coupling from the control (IN) input to the analog (NC, NO, or COM) output. This measure is in coulombs (C) and is the total charge induced due to switching of the control input. Charge injection, $Q_C = C_L \times \Delta V_O$, C_L is the load capacitance and ΔV_O is the change in analog output voltage. |
| $C_{NC(OFF)}$ | Capacitance at the NC port when the corresponding channel (NC to COM) is OFF |
| $C_{NO(OFF)}$ | Capacitance at the NO port when the corresponding channel (NC to COM) is OFF |
| $C_{NC(ON)}$ | Capacitance at the NC port when the corresponding channel (NC to COM) is ON |
| $C_{NO(ON)}$ | Capacitance at the NO port when the corresponding channel (NC to COM) is ON |
| $C_{COM(ON)}$ | Capacitance at the COM port when the corresponding channel (COM to NC or COM to NO) is ON |
| C_{IN} | Capacitance of IN |
| O_{ISO} | OFF isolation of the switch is a measurement of OFF-state switch impedance. This measure is in dB at a specific frequency, with the corresponding channel (NC to COM or NO to COM) in the OFF state. OFF isolation, $O_{ISO} = 20 \text{ LOG}(V_{NC}/V_{COM})$ dB, V_{COM} is the input and V_{NC} is the output. |
| X_{TALK} | Crosstalk is a measurement of unwanted signal coupling from an ON channel to an OFF channel (NC to NO or NO to NC). This measure is at a specific frequency and in dB. Crosstalk, $X_{TALK} = 20 \text{ log}(V_{NC1}/V_{NO1})$, V_{NO1} is the input and V_{NC1} is the output. |
| BW | Bandwidth of the switch. This is the frequency where the gain of an ON channel is -3 dB below the dc gain. Gain is measured from the equation, $20 \text{ log}(V_{NC}/V_{COM})$ dB, where V_{NC} is the output and V_{COM} is the input. |
| I_+ | Static power-supply current with the control (IN) pin at V_+ or GND |
| ΔI_+ | This is the increase in I_+ for each control (IN) input that is at the specified voltage, rather than at V_+ or GND. |

10 Detailed Description

10.1 Overview

The TS5A23157-Q1 is a 2 channel 2:1 switch (SPDT). It has a wide operating supply of 1.8 V to 5.5 V that allows for use in a wide array of applications from sample and hold circuits to communication protocol switching such as I2C or UART. The device supports bidirectional analog and digital signals on the source (NCx and NOx) and drain (COMx) pins.

10.2 Functional Block Diagram

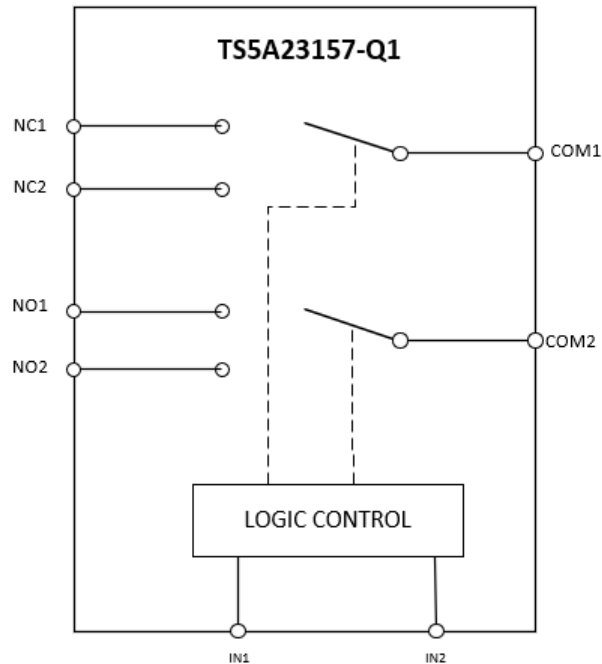

图 10-1. TS5A23157-Q1 Functional Block Diagram

10.3 Feature Description

Bidirectional Operation

The TS5A23157-Q1 conducts equally well from source (NCx and NOx) to drain (COMx) or from drain (COMx) to source (NCx and NOx). Each channel has similar characteristics in both directions and supports both analog and digital signals.

10.4 Device Functional Modes

The digital control pins (IN1 and IN2) are the logic pins that control their respective common connections (COM1 and COM2) with both the normally closed pathways (NC1 and NC2) and the normally open pathways (NO1 and NO2). When either or both digital control pins (IN1 and IN2) are pulled low their respective common (COM1 and COM2) and normally closed (NC1 and NC2) pins are connected. When either or both digital control pins (IN1 and IN2) are pulled high their respective common (COM1 and COM2) and normally open (NO1 and NO2) pins are connected.

The TS5A23157-Q1 can be operated without any external components except for the supply decoupling capacitors. Unused logic control pins (INx) should be tied to GND or VDD in order to ensure the device does not consume additional current as highlighted in Implications of Slow or Floating CMOS Inputs. Unused signal path inputs (NCx, NOx, and COMx) should be connected to GND.

11 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

11.1 Application Information

Common applications that require the features of the TS5A23157-Q1 include multiplexing various protocols from a processor MCU such as I2C, UART, or standard GPIO signals. With the TS5A23157-Q1's wide operating supply range different variations of signal levels with GPIO, UART, and I2C can all be passed and the supply voltage can vary with the needs of the system designer. A typical UART application is shown in the Typical Application Section.

11.2 Typical Application

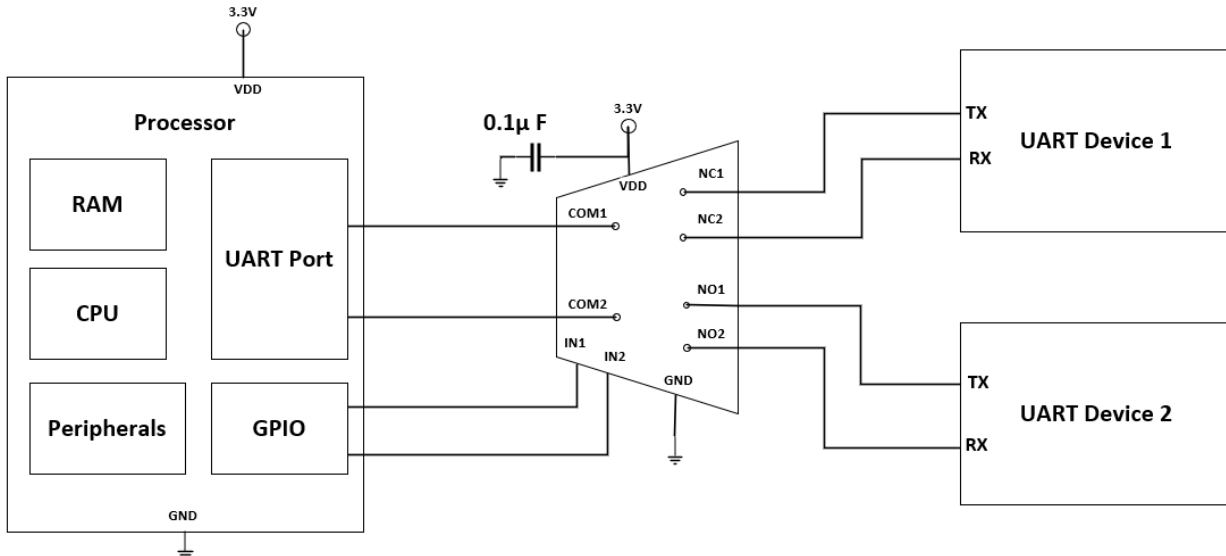

图 11-1. TS5A23157-Q1 Used in UART Application

11.3 Design Requirements

For the typical application shown above - please use the following parameters shown below.

表 11-1. Design Parameters

| PARAMETER | VALUE |
|------------------------|----------------|
| Supply Voltage | 3.3 V |
| Input / Output Voltage | 0 V - 3.3 V |
| Logic Input High | 2.31 V - 3.3 V |
| Logic Input Low | 0 V - 0.99 V |

11.4 Detailed Design Procedure

The TS5A23157-Q1 can be operated without any external components except for the supply decoupling capacitors. To ensure known logic states at start up - use pull-down resistors, between 10 K Ω and 100 K Ω , on each control input (INx). All inputs signals passing through the switch must fall within the recommend operating conditions of the TS5A23157-Q1 including signal range and continuous current. For this design example, with a supply of 3.3 V, the signals can range from 0 V to 3.3 V when the device is powered. Due to the voltage range and bandwidth of the switch, it can support many applications such as I2C, UART, and GPIO switching.

11.5 Application Performance Plots

Three important parameters when using the TS5A23157-Q1 in any communication protocol / GPIO switching application are the bandwidth of the switch as well as off isolation and cross talk. The below figure shows the typical bandwidth, off isolation, and cross talk versus frequency. When implementing this use case of the switch it is crucial to understand the AC error that other signals may create when using this device.

图 11-2. AC Parameters for TS5A23157-Q1 (V+ = 3V)

12 Power Supply Recommendations

The TS5A23157-Q1 operates across a wide supply range of 1.8 V to 5.5 V. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the devices. Power-supply bypassing improves noise margin and prevents switching noise propagation from the VDD supply to other components. Good power-supply decoupling is important to achieve optimum performance. For improved supply noise immunity, use a supply decoupling capacitor ranging from 0.1 μ F to 10 μ F from VDD to ground. Place the bypass capacitors as close to the power supply pins of the device as possible using low-impedance connections. TI recommends using multi-layer ceramic chip capacitors (MLCCs) that offer low equivalent series resistance (ESR) and inductance (ESL) characteristics for power-supply decoupling purposes. For very sensitive systems, or for systems in harsh noise environments, avoiding the use of vias for connecting the capacitors to the device pins may offer superior noise immunity. The use of multiple vias in parallel lowers the overall inductance and is beneficial for connections to ground planes.

13 Layout

13.1 Layout Guidelines

When a PCB trace turns a corner at a 90° angle, a reflection can occur. A reflection occurs primarily because of the change of width of the trace. At the apex of the turn, the trace width increases to 1.414 times the width. This increase upsets the transmission-line characteristics, especially the distributed capacitance and self-inductance of the trace which results in the reflection. Not all PCB traces can be straight and therefore some traces must turn corners. The figure below shows progressively better techniques of rounding corners. Only the last example (BEST) maintains constant trace width and minimizes reflections.

图 13-1. Trace Guidelines for TS5A23157-Q1

Route the high-speed signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around it to minimize its capacitance. Each via introduces discontinuities in the signal's transmission line and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points, through-hole pins are not recommended at high frequencies. Do not route high speed signal traces under or near crystals, oscillators, clock signal generators, switching regulators, mounting holes, magnetic devices or ICs that use or duplicate clock signals. Avoid stubs on the high-speed signals traces because they cause signal reflections. Route all high-speed signal traces over continuous GND planes, with no interruptions. Avoid crossing over anti-etch, commonly found with plane splits. When working with high frequencies, a printed circuit board with at least four layers is recommended; two signal layers separated by a ground and power layer as shown below.

图 13-2. Layer Stack Example for TS5A23157-Q1 device.

13.2 Layout Example

- Decouple the VDD pin with a 0.1 μ F capacitor, placed as close to the pin as possible.
- Make sure that the capacitor voltage rating is sufficient for the VDD supply.
- High-speed switches require proper layout and design procedures for optimum performance.
- Keep the input lines as short as possible.
- Use a solid ground plane to help reduce electromagnetic interference (EMI) noise pickup.

14.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
