

XC6423 Series

Ultra Small 300mA Dual High Speed LDO Regulator with Inrush Current Prevention

GENERAL DESCRIPTION

The XC6423 series is an ultra small CMOS dual LDO regulator, with 300mA output current capability. The series features high accuracy of 1% output voltages, high ripple rejection and low dropout voltage.

The series is available in LGA-6A01 (1.2mm × 1.2mm × h0.4mm) which features ultra small and high heat dissipation. The series is suited for high density board installation.

Each regulator can be turned off independently to be in stand-by mode by controlling EN pin. In this state, the electric charge at the output capacitor (C_L) is discharged via the internal auto-discharge switch, and as a result the V_{OUT} voltage quickly returns to the V_{SS} level.

The output stabilization capacitor (C_L) is also compatible with low ESR ceramic capacitors.

The high level of output stability is maintained even during frequent load fluctuations, due to the excellent transient response performance.

Over current protection circuit and over heat protection circuit are integrated, these circuits start working when output current reaches current limit or junction temperature reaches temperature limit.

The two regulators are completely isolated so that a cross talk during load fluctuations is minimized.

APPLICATIONS

- Smart phones / Mobile phones
- Wireless LAN
- Mobile devices / terminals
- Modules (wireless, cameras, etc.)

FEATURES

Output Current	: 300mA
Input Voltage Range	: 1.6V~5.5V
Output Voltage Range	: 1.2V~3.6V 0.05V increments
High Accuracy	: ±1% (V _{OUT} ≥ 2.00V) ±20mV (V _{OUT} ≤ 1.95V)
Dropout Voltage	: 95mV@I _{OUT} =150mA (V _{OUT} =3.0V)
Low Power Consumption	: 90 μA / ch (TYP.)
Stand-by Current	: Less than 0.1 μA
Ripple Rejection	: 75dB@1kHz
EN Pin Function	: Active High C _L Auto Discharge
Protection Circuit	: Current Limit 450mA (TYP.) Short-circuit Current 125mA (TYP.) Inrush Current Prevention Thermal Shutdown
Low ESR Capacitor	: Ceramic Capacitor Compatible 1 μF
Operating Ambient Temperature	: -40°C~+85°C
Package	: LGA-6A01
Environmentally Friendly	: EU RoHS Compliant, Pb Free

NOTE:

Unless otherwise stated, V_{IN} = V_{OUT(T)} + 1.0V, V_{EN} = V_{IN}

⁽¹⁾ V_{OUT(E)} is Effective output voltage

⁽²⁾ V_{OUT(T)} is Nominal output voltage

⁽³⁾ E-0: OUTPUT VOLTAGE (Refer to the Voltage Chart)

⁽⁴⁾ V_{dif} = {V_{IN1} - V_{OUT1}}

V_{IN1} is the input voltage when V_{OUT1} appears at the V_{OUT} pin while input voltage is gradually decreased.

V_{OUT1} is the voltage equal to 98% of the normal output voltage when amply stabilized V_{OUT(T)} + 1.0V is input at the V_{IN} pin.

⁽⁵⁾ E-1: DROPOUT VOLTAGE (Refer to the Voltage Chart)

⁽⁶⁾ E-1: When each channel is measured, the other channel is turned off (V_{EN} = V_{SS})

Circuit ①

Circuit ②

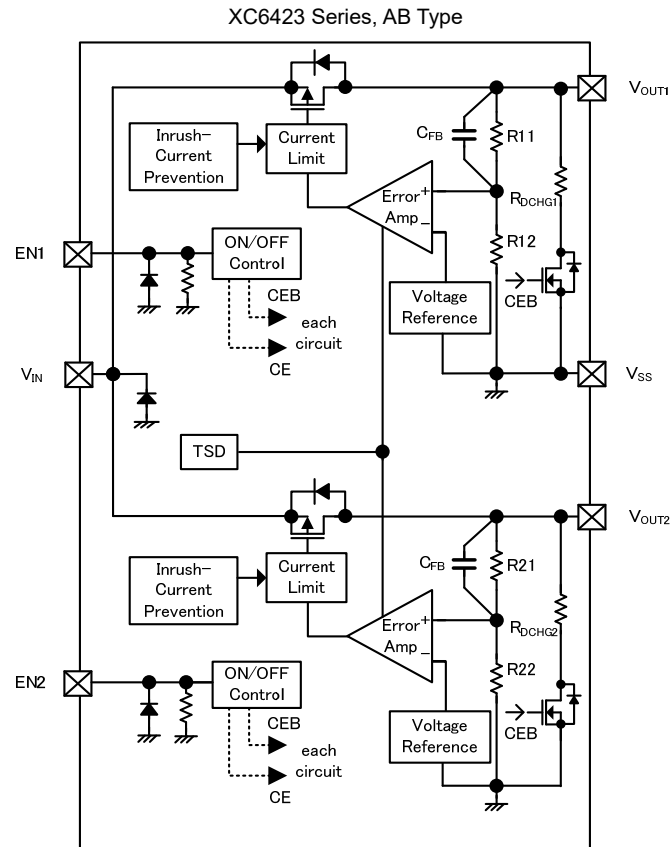

Circuit ③

OPERATIONAL EXPLANATION

The voltage divided by resistors Rx1 & Rx2 is compared with the internal reference voltage by the error amplifier. The P-ch MOSFET which is connected to the Output pin (V_{OUT}) is then driven by the subsequent control signal. The output voltage at the Output pin (V_{OUT}) is controlled and stabilized by a system of negative feedback. The current limit circuit, short circuit protection and thermal protection operate in relation to the level of output voltage, output current and heat dissipation.

<Low ESR Capacitor>

The XC6423 series needs an output capacitor (C_L) for phase compensation. In order to ensure the stable phase compensation, please place an output capacitor (C_L) of $1.0 \mu F$ or bigger at the V_{OUT} pin and V_{SS} pin as close as possible. For a stable power input, please connect an input capacitor (C_{IN}) of $1.0 \mu F$ between V_{IN} pin and V_{SS} pin.

<Current Limiter, Short-Circuit Protection>

The XC6423 series has current limiter and droop shape of fold-back circuit. When the load current reaches the current limit, the droop current limiter circuit operates and the output voltage drops with keeping the load current. After that, the output voltage drops to a certain level, the fold-back circuit operates and the output current goes to decrease with a degree of output voltage decreasing. The output current finally falls at the level of 125mA when the output pin is short-circuited.

<EN Pin>

The IC's internal circuitry can be shutdown via the signal from the EN pin. The XC6423 series has a pull-down resistor at the EN pin inside. Even the EN pin is left open, the EN pin is fixed as Low level. However, inflow current is generated into the EN pin.

■ OPERATIONAL EXPLANATION (Continued)

<C_L Auto-Discharge Function>

The N-ch transistor located between the V_{OUT} pin and the V_{SS} pin and the C_L discharge resistance is set to 270Ω (TYP.) when V_{IN} is 5.5V (TYP.) and V_{OUT} is 2.0V (TYP.).

This N-ch transistor can quickly discharge the electric charge at the output capacitor (C_L), when a low signal is inputted to the EN pin. Moreover, discharge time of the output capacitor (C_L) is set by the C_L auto-discharge resistance (R_{DCHG}) and the output capacitance (C_L).

By setting time constant of a C_L auto-discharge resistance (R_{DCHG}) and an output capacitance (C_L) as $\tau = C_L \times R_{DCHG}$, the output voltage after discharge via the N-ch transistor is calculated by the following formula.

$$V = V_{OUT(E)} \times e^{-t/\tau}$$

V: Output voltage after discharge

V_{OUT(E)}: Output voltage

t: Discharge time

$\tau = R_{DCHG} \times C_L$

C_L: Output capacitance

R_{DCHG}: C_L auto-discharge resistance

or discharge time is calculated by the next formula.

$$t = \tau \ln (V_{OUT(E)} / V)$$

<Thermal Shutdown>

When the junction temperature of the built-in driver transistor reaches the temperature limit, the thermal shutdown circuit operates and the driver transistor will be set to OFF. The IC resumes its operation when the thermal shutdown function is released and the IC's operation is automatically restored because the junction temperature drops to the level of the thermal shutdown release voltage.

<Inrush Current Prevention>

The inrush current prevention circuit is built in the XC6423 series.

When the IC starts to operate, the prevention circuit limits the inrush current as less than 150mA (TYP.) from input pin (V_{IN}) to output pin (V_{OUT}) for charging output capacitor (C_L).

■ NOTES ON USE

1. For temporary, transitional voltage drop or voltage rising phenomenon, the IC is liable to malfunction should the ratings be exceeded.
2. Where wiring impedance is high, operations may become unstable due to the noise and/or phase lag depending on output current.
Please strengthen V_{IN} and V_{SS} wiring in particular.
3. Please wire the input capacitor (C_{IN}) and the output capacitor (C_L) as close to the IC as possible.
4. Torex places an importance on improving our products and its reliability.
We request that users incorporate fail-safe designs and post-aging prevention treatment when using Torex products in their systems.

PACKAGING INFORMATION

● LGA-6A01 (unit:mm)

● LGA-6A01 Power Dissipation

Power dissipation data for the LGA-6A01 is shown in this page.
 The value of power dissipation varies with the mount board conditions.
 Please use this data as the reference data taken in the following condition.

1. Measurement Condition

- Condition : Mount on a board
- Ambient : Natural convection
- Soldering : Lead (Pb) free
- Board Dimensions : 40mm×40mm (1600mm² in one side)
- Metal Area : 1st Metal Layer about 50%
 2nd Inner Metal Layer about 50%
 3rd Inner Metal Layer about 50%
 4th Metal Layer about 50%
 Each heat sink back metal is connected to the Inner layers respectively.
- Material : Glass Epoxy (FR-4)
- Thickness : 1.0 mm
- Through-hole : 4 x 0.4 Diameter

Evaluation Board (Unit: mm)

2. Power Dissipation vs. Ambient Temperature Board Mount

Board Mount (Tjmax=125°C)

Ambient Temperature (°C)	Power Dissipation Pd (mW)	Thermal Resistance (°C/W)
25	650	153.85
85	260
