Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook ("Handling Precautions"/"Derating Concept and Methods") and individual reliability data (i.e. reliability test report and estimated failure rate, etc.).

Note 1: This device is considered as a two-terminal device: Pins 1 and 2 are shorted together, and pins 3 and 4 are shorted together.

Note: This device is sensitive to electrostatic discharge (ESD). Extreme ESD conditions should be guarded against by using proper antistatic precautions for the worktable, operator, solder iron, soldering equipment and so on.

**13. Soldering and Storage**

**13.1. Precautions for Soldering**

The soldering temperature should be controlled as closely as possible to the conditions shown below.

- When using soldering reflow

(See the figure shown below, which is based on the package surface temperature.)

Reflow soldering may be performed up to twice.

The first reflow soldering should be performed within 168 hours after opening the moisture-proof packaging.

The second reflow soldering must be performed within 168 hours of the first reflow.

**Fig. 13.1.1 An Example of a Temperature Profile When Lead(Pb)-Free Solder Is Used**

**13.2. Precautions for General Storage**

- Avoid storage locations where devices may be exposed to moisture or direct sunlight.
- Do not store the products in locations with poisonous gases (especially corrosive gases) or in dusty conditions.
- Store the products in locations with minimal temperature fluctuations. Rapid temperature changes during storage can cause condensation, resulting in lead oxidation or corrosion, which will deteriorate the solderability of the leads.
- Do not allow loads to be applied directly to devices while they are in storage.
- If devices have been stored for more than two years under normal storage conditions, it is recommended that you check the leads for ease of soldering prior to use.
- Follow the precautions printed on the packing label of the device for transportation and storage.
- Thermal stress may cause a crack in surface-mount products during surface-mount assembly if they have absorbed atmospheric moisture. To prevent a crack, please observe the following precautions.
  1. Moisture-proof bags may be stored unopened for up to 12 months under the following conditions.
    - Temperature: 5 °C to 30 °C
    - Humidity: 90 % (max)
  2. After opening the moisture-proof bag, the devices should be assembled within 168 hours in an environment of 5 °C to 30 °C/70 %RH or below.
  3. If, upon opening, the moisture indicator card shows a humidity of 30 % or above (i.e., has turned pink) or the expiration date has passed, the devices should be baked in tape and reel.
    - After baking, use the baked devices within 72 hours, but perform baking only once.
    - Baking conditions: 60±5 °C, for 64 to 72 hours.
    - Expiration date: 12 months from the sealing date, which is imprinted on the label affixed.
  4. Repeated baking can affect the peeling strength of taping and cause a trouble during mounting.
    - Furthermore, protect the devices against static electricity for baking.
  5. If the laminated packing material is broken, its hermeticity deteriorates. Therefore, do not throw or drop the packed devices.
  6. When restoring devices after removal from their packing, use anti-static containers.
