LINEAR INTEGRATED CIRCUIT

HIGH PERFORMANCE CURRENT MODE PWM CONTROLLERS

DESCRIPTION

The UTC **UC2844/2845** are high performance fixed frequency current mode controllers that specifically designed for Off-Line and DC to DC converter applications with minimal external parts count.

The differences between **UC2844** and **UC2845** are the maximum duty cycle ranges and under-voltage lockout thresholds. The **UC2844** ideally suited to off-line applications with UVLO thresholds of 16V_(ON) and 10V_(OFF), and **UC2845** has UVLO thresholds of 8.5V_(ON) and 7.6V_(OFF) for lower voltage applications.

PIN CONFIGURATION

PIN DESCRIPTION

| PIN NO | PIN NAME | FUNCTION |
|--------|--------------------------------|---|
| 1 | Compensation | Error amplifier output, this pin is made available for loop compensation. |
| 2 | V _{FB} | Voltage Feedback, the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider. |
| 3 | I _{SENSE} | A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction. |
| 4 | R _T /C _T | The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor R _T to V _{REF} and capacitor C _T to ground. Operation to 1 MHz is possible. |
| 5 | GND | Power ground. |
| 6 | Output | This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. The output switches at one-half the oscillator frequency. |
| 7 | V _{CC} | Positive supply. |
| 8 | V _{REF} | Reference output, provides charging current for capacitor C _T though resistor R _T . |

2. This parameter is measured at the latch trip point with $V_{FB}=0V$.

3. Comparator gain is defined as: $A_V = \frac{\Delta V \text{ Output Compensation}}{\Delta V \text{ Current Sense Input}}$

4. Adjust V_{CC} above the startup threshold before setting to 15V.
