

**Vishay Siliconix** 

# Integrated DrMOS Power Stage

#### DESCRIPTION

The SiC780 is an integrated power stage solution optimized for synchronous buck applications offering high current, high efficiency and high power density. Packaged in Vishay's proprietary 6 mm x 6 mm MLP package, SiC780 enables voltage regulator designs to deliver in excess of 50 A per phase current with 93 % peak efficiency.

The internal Power MOSFETs utilize Vishay's state-of-the-art TrenchFET Gen III technology that delivers industry benchmark performance by significantly reducing switching and conduction losses.

The SiC780 incorporates an advanced MOSFET gate driver IC that features high current driving capability, adaptive dead-time control, and integrated bootstrap Schottky diode, and a thermal warning (THDN) that alerts the system of excessive junction temperature. The driver is also compatible with a wide range of PWM controllers and supports Tri-state PWM, 3.3 V (SiC780ACD)/5 V (SiC780CD) PWM logic, and skip mode (SMOD) to improve light load efficiency.

### **FEATURES**

- Thermally enhanced PowerPAK MLP6x6-40L package
- Industry benchmark MOSFET with integrated Schottky diode
- Delivers in excess of 50 A continuous current
- 93 % peak efficiency
- High frequency operation up to 1 MHz
- Power MOSFETs optimized for 12 V input stage
- 3.3 V (SiC780ACD)/5 V (SiC780CD) PWM logic with Tri-state and hold-off
- SMOD logic for light load efficiency boost
- Low PWM propagation delay (< 20 ns)</li>
- Thermal monitor flag
- Enable feature
- V<sub>CIN</sub> UVLO
- Compliant with Intel DrMOS 4.0 specification
- Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

#### **APPLICATIONS**

- Synchronous buck converters
- · Multi-phase VRDs for CPU, GPU and memory
- DC/DC POL modules

### **DETAILED OPERATIONAL DESCRIPTION**

#### **PWM Input with Tri-State Function**

The PWM input receives the PWM control signal from the VR controller IC. The PWM input is designed to be compatible with standard controllers using two state logic (H and L) and advanced controllers that incorporate Tri-state logic (H, L and Tri-state) on the PWM output. For two state logic, the PWM input operates as follows. When PWM is driven above  $V_{th\ \_pwm\_r}$  the low side is turned OFF and the high side is turned ON. When PWM input is driven below V<sub>th pwm f</sub> the high side turns off and the low side turns on.

For Tri-state logic, the PWM input operates as above for driving the MOSFETs. However, there is an third state that is entered into as the PWM output of Tri-state compatible controller enters its high impedance state during shut-down. The high impedance state of the controller's PWM output allows the SiC780A to pull the PWM input into the Tri-state region (see the Tri-State Voltage Threshold Diagram below). If the PWM input stays in this region for the Tri-state Hold-Off Period, t<sub>TSHO</sub>, both high side and low side MOSFETs are turned off. This function allows the VR phase to be disabled without negative output voltage swing caused by inductor ringing and saves a Schottky diode clamp. The PWM and Tri-state regions are separated by hysteresis to prevent false triggering. The SiC780ACD incorporates PWM voltage thresholds that are compatible with 3.3 V logic, and SiC780CD is 5 V logic.

#### Disable (DSBL#)

In the low state, the DSBL# pin shuts down the driver IC and disables both high-side and low-side MOSFET. In this state, the standby current is minimized. If DSBL# is left unconnected an internal pull-down resistor will pull the pin down to  $C_{GND}$  and shut down the IC.

#### **Diode Emulation Mode (SMOD) Skip**

When SMOD pin is low the diode emulation mode is enabled and GL is turned off. This is a non-synchronous conversion mode that improves light load efficiency by reducing switching losses. Conducted losses that occur in synchronous buck regulators when inductor current is negative can also be reduced. Circuitry in the external controller IC detects when inductor current crosses zero and drive SMOD Lo turning the low side MOSFET off. See SMOD Operation diagram for additional details. This function can be also be used for a pre-biased output voltage. If SMOD is left unconnected, an internal pull up resistor will pull the pin up to V<sub>CIN</sub> (Logic High) to disable the SMOD function.

#### **Thermal Shutdown Warning (THDN)**

The THDN pin is an open drain signal that flags the presence of excessive junction temperature. Connect a maximum of 20 k $\Omega$  to pull this pin up to V<sub>CIN</sub>. An internal temperature sensor detects the junction temperature. The temperature threshold is 160 °C. When this junction temperature is exceeded the THDN flag is set. When the junction temperature drops below 135 °C the device will clear the

THDN signal. The SiC780 does not stop operation when the flag is set. The decision to shutdown must be made by an external thermal control function.

#### Voltage Input (VIN)

This is the power input to the drain of the high-side power MOSFET. This pin is connected to the high power intermediate BUS rail.

#### Switch Node (V<sub>SWH</sub> and PHASE)

The switch node  $V_{\mbox{\scriptsize SWH}}$  is the circuit PWM regulated output. This is the output applied to the filter circuit to deliver the regulated high output for the buck converter. The PHASE pin is internally connected to the switch node V<sub>SWH</sub>. This pin is to be used exclusively as the return pin for the BOOT capacitor. A 20.2 k $\Omega$  resistor is connected between GH and PHASE to provide a discharge path for the HS MOSFET in the event that V<sub>CIN</sub> goes to zero while V<sub>IN</sub> is still applied.

#### Ground Connections (C<sub>GND</sub> and P<sub>GND</sub>)

PGND (power ground) should be externally connected to C<sub>GND</sub> (control signal ground). The layout of the Printed Circuit Board should be such that the inductance separating the  $C_{GND}$  and  $P_{GND}$  should be a minimum. Transient differences due to inductance effects between these two pins should not exceed 0.5 V.

#### Control and Drive Supply Voltage Input (VDRV,VCIN)

 $V_{CIN}$  is the bias supply for the gate drive control IC.  $V_{DBV}$  is the bias supply for the gate drivers. It is recommended to separate these pins through a resistor. This creates a low pass filtering effect to avoid coupling of high frequency gate drive noise into the IC.

#### Bootstrap Circuit (BOOT)

The internal bootstrap switch and an external bootstrap capacitor form a charge pump that supplies voltage to the BOOT pin. An integrated bootstrap diode is incorporated so that only an external capacitor is necessary to complete the bootstrap circuit. Connect a boot strap capacitor with one leg tied to BOOT pin and the other tied to PHASE pin.

#### Shoot-Through Protection and Adaptive Dead Time (AST)

The SiC780A has an internal adaptive logic to avoid shoot through and optimize dead time. The shoot through protection ensures that both high-side and low-side MOSFET are not turned on the same time. The adaptive dead time control operates as follows. The HS and LS gate voltages are monitored to prevent the one turning on until the other's gate voltage is sufficiently low (1 V), that and built in delays ensure the one power MOS is completely off, before the other can be turned on. This feature helps to adjust dead time as gate transitions change with respect to output current and temperature.

S14-1497-Rev. D, 04-Aug-14

### Under Voltage Lockout (UVLO)

During the start up cycle, the UVLO disables the gate drive holding high-side and low-side MOSFET gate low until the input voltage rail has reached a point at which the logic circuitry can be safely activated. The SiC780A also incorporates logic to clamp the gate drive signals to zero when the UVLO falling edge triggers the shutdown of the device. As an added precaution, a 20.2 k $\Omega$  resistor is connected between GH and PHASE to provide a discharge path for the HS MOSFET.

E2-3	1.95	2.00	2.05	0.076	0.078	0.080	
K1		0.73 BSC			0.028 BSC		
K2	0.21 BSC			0.008 BSC			

DWG: 5986

Notes

1. Use millimeters as the primary measurement

2. Dimensioning and tolerances conform to ASME Y14.5M. - 1994

3. N is the number of terminals. Nd is the number of terminals in X-direction and Ne is the number of terminals in Y-direction

 $\Delta$ Dimension b applies to plated terminal and is measured between 0.20 mm and 0.25 mm from terminal tip

🛕 The pin #1 identifier must be existed on the top surface of the package by using indentation mark or other feature of package body

Exact shape and size of this feature is optional

7. Package warpage max. 0.08 mm

Applied only for terminals

Revision: 12-Jan-15

# Disclaimer

ALL PRODUCT, PRODUCT SPECIFICATIONS AND DATA ARE SUBJECT TO CHANGE WITHOUT NOTICE TO IMPROVE RELIABILITY, FUNCTION OR DESIGN OR OTHERWISE.

Vishay Intertechnology, Inc., its affiliates, agents, and employees, and all persons acting on its or their behalf (collectively, "Vishay"), disclaim any and all liability for any errors, inaccuracies or incompleteness contained in any datasheet or in any other disclosure relating to any product.

Vishay makes no warranty, representation or guarantee regarding the suitability of the products for any particular purpose or the continuing production of any product. To the maximum extent permitted by applicable law, Vishay disclaims (i) any and all liability arising out of the application or use of any product, (ii) any and all liability, including without limitation special, consequential or incidental damages, and (iii) any and all implied warranties, including warranties of fitness for particular purpose, non-infringement and merchantability.

Statements regarding the suitability of products for certain types of applications are based on Vishay's knowledge of typical requirements that are often placed on Vishay products in generic applications. Such statements are not binding statements about the suitability of products for a particular application. It is the customer's responsibility to validate that a particular product with the properties described in the product specification is suitable for use in a particular application. Parameters provided in datasheets and / or specifications may vary in different applications and performance may vary over time. All operating parameters, including typical parameters, must be validated for each customer application by the customer's technical experts. Product specifications do not expand or otherwise modify Vishay's terms and conditions of purchase, including but not limited to the warranty expressed therein.

Except as expressly indicated in writing, Vishay products are not designed for use in medical, life-saving, or life-sustaining applications or for any other application in which the failure of the Vishay product could result in personal injury or death. Customers using or selling Vishay products not expressly indicated for use in such applications do so at their own risk. Please contact authorized Vishay personnel to obtain written terms and conditions regarding products designed for such applications.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted by this document or by any conduct of Vishay. Product names and markings noted herein may be trademarks of their respective owners.
