

Vishay Siliconix

Low-Voltage Sub- Ω SPST/SPDT MICRO FOOT[®] Analog Switch

DESCRIPTION

The DG3001, DG3002, DG3003 are monolithic CMOS analog switches designed for high performance switching of analog signals. The DG3001 and DG3002 are configured as SPST switches, and the DG3003 is an SPDT switch. Combining low power, high speed (t_{ON} : 47 ns, t_{OFF} : 40 ns), low on-resistance ($R_{DS(on)}$: 0.4 Ω) and small physical size (MICRO FOOT, 6-bump), the DG3001, DG3002, DG3003 are ideal for portable and battery powered applications requiring high performance and efficient use of board space.

The DG3001, DG3002, DG3003 are built on Vishay Siliconix's low voltage JI2 process. An epitaxial layer prevents latchup.

Each switch conducts equally well in both directions when on, and blocks up to the power supply level when off.

As a committed partner to the community and the environment, Vishay Siliconix manufactures this product with the lead (Pb)-free device terminations. For MICRO FOOT analog switching products manufactured with tin/silver/copper (Sn/Ag/Cu) device terminations, the lead (Pb)-free "-E1" suffix is being used as a designator.

FEATURES

- MICRO FOOT chip scale package (1 mm x 1.5 mm)
- Low voltage operation (1.8 V to 5.5 V)
- Low on-resistance R_{DS(on)}: 0.4 Ω
- Fast switching t_{ON} : 47 ns, t_{OFF}: 40 ns
- Low power consumption
- TTL/CMOS compatible

BENEFITS

- · Reduced power consumption
- Simple logic interface
- High accuracy
- · Reduce board space

APPLICATIONS

- Cellular phones
- Communication systems
- Portable test equipment
- Battery operated systems
- PCM cards
- PDA

Notes:

a. Room = 25 °C, full = as determined by the operating suffix.

b. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.

c. Typical values are for design aid only, not guaranteed nor subject to production testing.

THE PRODUCTS DESCRIBED HEREIN AND THIS DOC Downloaded From Oneyac.com

d. Guarantee by design, nor subjected to production test.

e. V_{IN} = input voltage to perform proper function.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

AN824 Vishay Siliconix

PCB Design and Assembly Guidelines For MICRO FOOT[®] Products

Johnson Zhao

INTRODUCTION

Vishay Siliconix's MICRO FOOT product family is based on a wafer-level chip-scale packaging (WL-CSP) technology that implements a solder bump process to eliminate the need for an outer package to encase the silicon die. MICRO FOOT products include power MOSFETs, analog switches, and power ICs.

For battery powered compact devices, this new packaging technology reduces board space requirements, improves thermal performance, and mitigates the parasitic effect typical of leaded packaged products. For example, the 6-bump MICRO FOOT Si8902EDB common drain power MOSFET, which measures just 1.6 mm x 2.4 mm, achieves the same performance as TSSOP-8 devices in a footprint that is 80% smaller and with a 50% lower height profile (Figure 1). A MICRO FOOT analog switch, the 6-bump DG3000DB, offers low charge injection and 1.4 W on-resistance in a footprint measuring just 1.08 mm x 1.58 mm (Figure 2).

Vishay Siliconix MICRO FOOT products can be handled with the same process techniques used for high-volume assembly of packaged surface-mount devices. With proper attention to PCB and stencil design, the device will achieve reliable performance without underfill. The advantage of the device's small footprint and short thermal path make it an ideal option for space-constrained applications in portable devices such as battery packs, PDAs, cellular phones, and notebook computers.

This application note discusses the mechanical design and reliability of MICRO FOOT, and then provides guidelines for board layout, the assembly process, and the PCB rework process.

FIGURE 2. Outline of MICRO FOOT CSP & Analog Switch DG3000DB

MICRO FOOT UCSP Analog Switch		0.5	0.32-0.34	0.21-0.24	

* All measurements in millimeters

MICRO FOOT'S DESIGN AND RELIABILITY

As a mechanical, electrical, and thermal connection between the device and PCB, the solder bumps of MICRO FOOT products are mounted on the top active surface of the die. Table 1 shows the main parameters for solder bumps used in MICRO FOOT products. A silicon nitride passivation layer is applied to the active area as the last masking process in fabrication, ensuring that the device passes the pressure pot test. A green laser is used to mark the backside of the die without damaging it. Reliability results for MICRO FOOT products mounted on a FR-4 board without underfill are shown in Table 2.

TABLE 2 MICRO FOOT Reliability Results				
Test Condition C: -65° to 150°C >500 Cycles				
Test condition B: -40° to 125°C	>1000 Cycles			
121°C @ 15PSI 100% Humidity Test	96 Hours			

The main failure mechanism associated with wafer-level chip-scale packaging is fatigue of the solder joint. The results shown in Table 2 demonstrate that a high level of reliability can be achieved with proper board design and assembly techniques.

BOARD LAYOUT GUIDELINES

Board materials. Vishay Siliconix MICRO FOOT products are designed to be reliable on most board types, including organic boards such as FR-4 or polyamide boards. The package qualification information is based on the test on 0.5-oz. FR-4 and polyamide boards with NSMD pad design.

Land patterns. Two types of land patterns are used for surface-mount packages. Solder mask defined (SMD) pads have a solder mask opening smaller than the metal pad (Figure 3), whereas on-solder mask defined (NSMD) pads have a metal pad smaller than the solder-mask opening (Figure 4).

NSMD is recommended for copper etch processes, since it provides a higher level of control compared to SMD etch processes. A small-size NSMD pad definition provides more area (both lateral and vertical) for soldering and more room for escape routing on the PCB. By contrast, SMD pad definition introduces a stress -concentration point near the solder mask on the PCB side that may result in solder joint cracking under extreme fatigue conditions.

Copper pads should be finished with an organic solderability preservative (OSP) coating. For electroplated nickel-immersion gold finish pads, the gold thickness must be less than 0.5 μ m to avoid solder joint embrittlement.

Solder Mask

Board pad design. The landing-pad size for MICRO FOOT products is determined by the bump pitch as shown in Table 3. The pad pattern is circular to ensure a symmetric, barrel-shaped solder bump.

TABLE 3 Dimensions of Copper Pad and Solder Mask Opening in PCB and Stencil Aperture					
Pitch	Pitch Copper Pad Solder Mask Stencil Aperture Stencil Solder Mask Stencil				
0.80 mm	$0.30 \pm 0.01 \text{ mm}$	$0.41 \pm 0.01 \text{ mm}$	$0.33 \pm 0.01 \text{ mm}$ in ciircle aperture		
0.50 mm	0.17 \pm 0.01 mm	0.27 \pm 0.01 mm	$\begin{array}{c} 0.30\ \pm\ 0.01\ \text{mm}\\ \text{in square aperture} \end{array}$		

ASSEMBLY PROCESS

MICRO FOOT products' surface-mount-assembly operations include solder paste printing, component placement, and solder reflow as shown in the process flow chart (Figure 5).

FIGURE 5. SMT Assembly Process Flow

Stencil design. Stencil design is the key to ensuring maximum solder paste deposition without compromising the assembly yield from solder joint defects (such as bridging and extraneous solder spheres). The stencil aperture is dependent on the copper pad size, the solder mask opening, and the quantity of solder paste.

In MICRO FOOT products, the stencil is 0.125-mm (5-mils) thick. The recommended apertures are shown in Table 3 and are fabricated by laser cut.

Solder-paste printing. The solder-paste printing process involves transferring solder paste through pre-defined apertures via application of pressure.

In MICRO FOOT products, the solder paste used is UP78 No-clean eutectic 63 Sn/37Pb type3 or finer solder paste.

Chip pick-and-placement. MICRO FOOT products can be picked and placed with standard pick-and-place equipment. The recommended pick-and-place force is 150 g. Though the part will self-center during solder reflow, the maximum placement offset is 0.02 mm.

Reflow Process. MICRO FOOT products can be assembled using standard SMT reflow processes. Similar to any other package, the thermal profile at specific board locations must be determined. Nitrogen purge is recommended during reflow operation. Figure 6 shows a typical reflow profile.

FIGURE 6. Reflow Profile

PCB REWORK

To replace MICRO FOOT products on PCB, the rework procedure is much like the rework process for a standard BGA or CSP, as long as the rework process duplicates the original reflow profile. The key steps are as follows:

- 1. Remove the MICRO FOOT device using a convection nozzle to create localized heating similar to the original reflow profile. Preheat from the bottom.
- 2. Once the nozzle temperature is +190°C, use tweezers to remove the part to be replaced.
- 3. Resurface the pads using a temperature-controlled soldering iron.
- 4. Apply gel flux to the pad.
- 5. Use a vacuum needle pick-up tip to pick up the replacement part, and use a placement jig to placed it accurately.
- 6. Reflow the part using the same convection nozzle, and preheat from the bottom, matching the original reflow profile.

Vishay
