

# 300-mA Ultra Low-Noise LDO Regulator With Discharge Option

## FEATURES

- Ultra Low Dropout—300 mV at 300-mA Load
- Ultra Low Noise—30 μV<sub>RMS</sub> (10-Hz to 100-kHz)
- Shutdown Control
- 130-μA Ground Current at 300-mA Load
- 1.5% Guaranteed Output Voltage Accuracy
- 400-mA Peak Output Current Capability
- Uses Low ESR Ceramic Capacitors
- Fast Start-Up (50 μs)
- Fast Line and Load Transient Response (≤ 30 µs)
- 1-μA Maximum Shutdown Current
- Output Current Limit
- Reverse Battery Protection
- Built-in Short Circuit and Thermal Protection

- Output, Auto-Discharge In Shutdown Mode
- Fixed 1.2, 1.8, 2.5, 2.6, 2.8, 3.0, 3.3, 5.0-V Output Voltage Options
- MLP33-5 PowerPAK® Package

#### **APPLICATIONS**

- Cellular Phones, Wireless Handsets
- Noise-Sensitive Electronic Systems, Laptop and Palmtop Computers
- PDAs
- Pagers
- Digital Cameras
- MP3 Player
- Wireless Modem

#### DESCRIPTION

The Si91871 is a 300-mA CMOS LDO (low dropout) voltage regulator. It is the perfect choice for low voltage, low power applications. An ultra low ground current makes this part attractive for battery operated power systems. The Si91871 also offers ultra low dropout voltage to prolong battery life in portable electronics. Systems requiring a quiet voltage source, such as RF applications, will benefit from the Si91871's ultra low output noise. An external noise bypass capacitor connected to the device's BP pin can further reduce the noise level. The Si91871 is designed to maintain regulation while delivering 400-mA peak current, making it ideal for systems that have a high surge current upon turn-on.

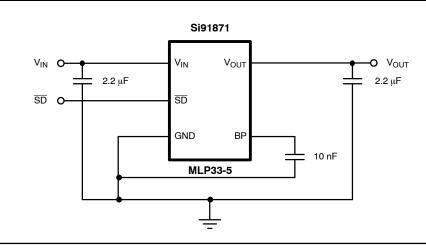

For better transient response and regulation, an active

pull-down circuit is built into the Si91871 to clamp the output voltage when it rises beyond normal regulation. The Si91871 automatically discharges the output voltage by connecting the output to ground through a  $100-\Omega$  n-channel MOSFET when the device is put in shutdown mode.

The Si91871 features reverse battery protection to limit reverse current flow to approximately 1- $\mu$ A in the event reversed battery is applied at the input, thus preventing damage to the IC.

The Si91871 is available in both the standard and lead (Pb)-free 5-pin MLP33 PowerPAK packages and is specified to operate over the industrial temperature range of  $-40^{\circ}$ C to 85°.

Notes

Room = 25°C, Full = -40 to 85°C. a.

The algebraic convention whereby the most negative value is a minimum and the most positive a maximum. b.

Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing. Typical values for dropout voltage at  $V_{OUT} \ge 2$  V are measured at  $V_{OUT} = 3.3$  V, while typical values for dropout voltage at  $V_{OUT} < 2$  V are measured at  $V_{OUT} = 1.8$  V. Dropout voltage is defined as the input to output differential voltage at which the output voltage drops 2% below the output voltage measured with a 1-V c.

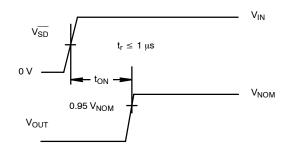

d. differential, provided that VIN does not not drop below 2.0 V.

e.

Ground current is specified for normal operation as well as "drop-out" operation. The device's shutdown pin includes a typical 2-MΩ internal pull-down resistor connected to ground. f.

 $V_{OUT(nom)}$  is  $V_{OUT}$  when measured with a 1-V differential to  $V_{IN}$ g.

#### FUNCTIONAL BLOCK DIAGRAM

Downloaded From Oneyac.com

# DETAILED DESCRIPTION

The Si91871 is a low-noise, low drop-out and low quiescent current linear voltage regulator, packaged in a small footprint MLP33-5 package. The Si91871 can supply loads up to 300 mA. As shown in the block diagram, the circuit consists of a bandgap reference error, amplifier, p-channel pass transistor and feedback resistor string. An external bypass capacitor connected to the BP pin reduces noise at the output. Additional blocks, not shown in the block diagram, include a precise current limiter, reverse battery and current protection and thermal sensor.

#### **Thermal Overload Protection**

The thermal overload protection limits the total power dissipation and protects the device from being damaged. When the junction temperature exceeds 150°C, the device turns the p-channel pass transistor off.

#### **Reverse Battery Protection**

The Si91871 has a battery reverse protection circuitry that disconnects the internal circuitry when V<sub>IN</sub> drops below the GND voltage. There is no current drawn in such an event. When the SD pin is hardwired to V<sub>IN</sub>, the user must connect the SD pin to V<sub>IN</sub> via a 100-k $\Omega$  resistor if reverse battery protection is desired. Hardwiring the SD pin directly to the V<sub>IN</sub> pin is allowed when reverse battery protection is not desired.

#### **Noise Reduction**

An external 10-nF bypass capacitor at BP is used to create a low pass filter for noise reduction. The start-up time is fast, since a power-on circuit pre-charges the bypass capacitor. After the power-up sequence the pre-charge circuit is switched to standby mode in order to save current. It is therefore not recommended to use larger bypass capacitor values than 50 nF. When the circuit is used without a capacitor, stable operation is guaranteed.

#### Auto-Discharge

The Si91871 V<sub>OUT</sub> has an internal 100- $\Omega$  (typ.) discharge path to ground when the  $\overline{SD}$  pin is low.

#### Stability

The circuit is stable with only a small output capacitor equal to 6 nF/mA (= 2  $\mu$ F @ 300 mA). Since the bandwidth of the error amplifier is around 1–3 MHz and the dominant pole is at the output node, the capacitor should be capacitive in this range, i.e., for 150-mA load current, an ESR <0.2  $\Omega$  is necessary. Parasitic inductance of about 10 nH can be tolerated.

#### Safe Operating Area

The ability of the Si91871 to supply current is ultimately dependent on the junction temperature of the pass device. Junction temperature is in turn dependent on power

dissipation in the pass device, the thermal resistance of the package and the circuit board, and the ambient temperature. The power dissipation is defined as

$$\mathsf{P}_\mathsf{D} = (\mathsf{V}_\mathsf{IN} - \mathsf{V}_\mathsf{OUT}) * \mathsf{I}_\mathsf{OUT} \,.$$

Junction temperature is defined as

$$T_{J} = T_{A} + ((P_{D} * (R\theta_{JC} + R\theta_{CA})).$$

To calculate the limits of performance, these equations must be rewritten.

Allowable power dissipation is calculated using the equation

$$P_{D} = (T_{J} - T_{A}) / (R\theta_{JC} + R\theta_{CA})$$

While allowable output current is calculated using the equation

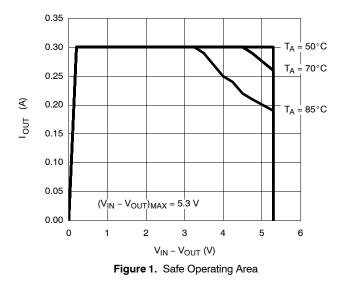

$$I_{OUT} = (T_J - T_A) / (R\theta_{JC} + R\theta_{CA}) * (V_{IN} - V_{OUT}).$$

Ratings of the Si91871 that must be observed are

$$T_{Jmax} = 125 \text{ °C}, T_{Amax} = 85 \text{ °C}, (V_{IN} - V_{OUT})_{max} = 5.3 \text{ V}, R\theta_{JC} = 8 \text{ °C/W}.$$

The value of  $R\theta_{CA}$  is dependent on the PC board used. The value of  $R\theta_{CA}$  for the board used in device characterization is approximately 46 °C/W.

Figure 1 shows the performance limits graphically for the Si91871 mounted on the circuit board used for thermal characterization.
