

Low-Power, High-Speed CMOS Analog Switches

DESCRIPTION

The DG401B, DG403B, DG405B monolithic analog switches are replacements for the popular DG401/403/405 analog switches and provide improved performance, combining high speed (t_{ON} : 100 ns, typ) with low power consumption make the DG401B series ideal for portable and battery powered applications.

Built on the Vishay Siliconix proprietary high-voltage silicongate process to achieve high voltage rating and superior switch on/off performance, break-before-make is guaranteed for the SPDT configurations.

Each switch conducts equally well in both directions when on, and blocks up to 30 V peak-to-peak when off. On-resistance is very flat over the full \pm 15 V analog range. The DG401B has two independent SPST switches. The DG403B has four SPST switches in NO/NC combinations. The DG405B has four switches in two SPST pairs (see Functional Block Diagrams and Pin Configurations on pages 1 and 2.)

The DG401B, DG403B, DG405B is available in both 16-pin plastic dip and 16-pin SOIC packages.

As a committed partner to the community and the environment, Vishay Siliconix manufactures this product with the lead (Pb)-free device terminations. For analog switching products manufactured with 100 % matte tin device terminations, the lead (Pb)-free "-E3" suffix is being used as a designator.

FEATURES

- 44 V supply max rating
- ± 15 V analog signal range
- On-resistance R_{DS(on)}: 23 Ω
- Low leakage I_{D(on)}: 40 pA
- Fast switching t_{ON}: 100 ns
- Upgrade to DG401B, DG403B, DG405B
- TTL, CMOS compatible
- · Single supply capability

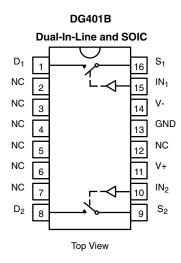

BENEFITS

- Wide dynamic range
- Break-before-make switching action (DG403B only)
- Simple interfacing

APPLICATIONS

- · Audio and video switching
- Sample-and-hold circuits
- Test equipment
- PBX, PABX

ABSOLUTE MAXIMUM RATINGS						
Parameter		Symbol	Limit	Unit		
V+ to V-			44	v		
GND to V-			25			
Digital Inputs ^a , V _S , V _D			(V-) - 0.3 V to $(V+)$ + 0.3 V or 30 mA, whichever occurs first			
Current (Any Terminal) Continuous			30			
Current, S or D (Pulsed 1 ms 10 % duty)			100	— mA		
Storage Temperature	(DJ, DY Suffix)		- 65 to 125	°C		
Demor Dissingtion (Decksors) ^b	16-Pin Plastic DIP ^c		450	mW		
Power Dissipation (Package) ^b	16-Pin SOIC ^d		600	11100		

Notes:

a. Signals on S_X , D_X , or IN_X exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings. b. All leads welded or soldered to PC board.

c. Derate 6 mW/°C above 75 °C.

d. Derate 7.6 mW/°C above 75 °C.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Notes:

a. Refer to PROCESS OPTION FLOWCHART.

b. Room = 25 $^{\circ}$ C, Full = as determined by the operating temperature suffix.

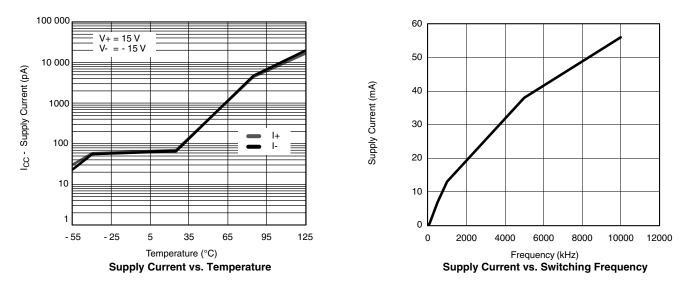

c. Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.

d. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.

e. Guaranteed by design, not subject to production test.

f. V_{IN} = input voltage to perform proper function.

APPLICATIONS

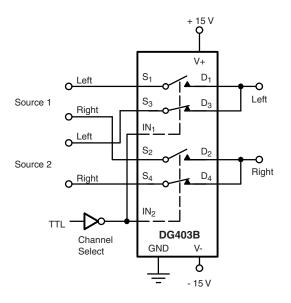

Figure 9. Stereo Source Selector

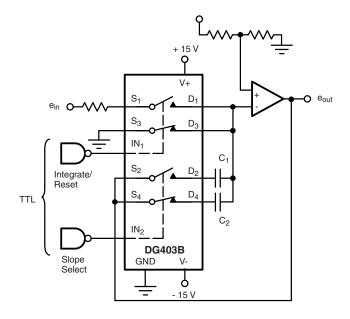

Figure 10. Dual Slope Integrator

Dual Slope Integrators

The DG403B is well suited to configure a selectable slope integrator. One control signal selects the timing capacitor C_1 or C_2 . Another one selects e_{in} or discharges the capacitor in preparation for the next integration cycle.

Band-Pass Switched Capacitor Filter

Single-pole double-throw switches are a common element for switched capacitor networks and filters. The fast switching times and low leakage of the DG403B allow for higher clock rates and consequently higher filter operating frequencies.

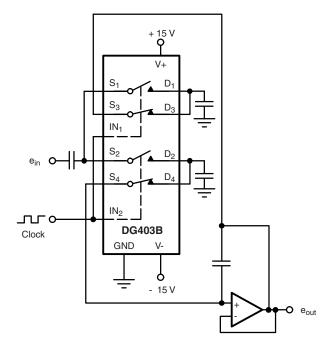

Figure 11. Band-Pass Switched Capacitor Filter

APPLICATIONS

Peak Detector

 A_3 acting as a comparator provides the logic drive for operating SW₁. The output of A_2 is fed back to A_3 and compared to the analog input ein. If $e_{in} > e_{out}$ the output of A_3 is high keeping SW₁ closed. This allows C₁ to charge up to the analog input voltage. When e_{in} goes below $e_{out} \ A_3$ goes negative, turning SW_1 off. The system will therefore store the most positive analog input experienced.

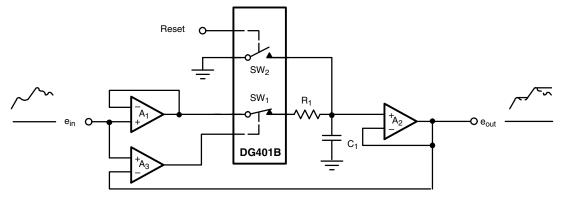

Figure 12. Positive Peak Detector

Vishay Siliconix maintains worldwide manufacturing capability. Products may be manufactured at one of several qualified locations. Reliability data for Silicon Technology and Package Reliability represent a composite of all qualified locations.
