

## Automotive 125 °C Analog Switch Dual DPDT / Quad SPDT, 0.37 Ω, 338 MHz Bandwidth

#### DESCRIPTION

The DGQ2788A, is a four-channel single-pole double-throw (SPDT) analog switch with two control inputs. It is also known as a two-channel double-pole double-throw (DPDT) configuration. The part is designed to operate from 1.8 V to 5.5 V single power rail. All switches conduct equally well in both directions, offering rail to rail signal switching and can be used both as multiplexers as well as de-multiplexers.

The DGQ2788A offers low parasitic capacitance and highly matched low and flat switch resistance over the full signal range. It features break-before-make switching and low control logic threshold. The part supports rail to rail fast edge pulsing signals and have 0.1 ns/typ. propagation delay. It is ideal for both analog and digital signal switching in space constrain applications requiring high performance and efficient use of board space.

The DGQ2788A comes in a small miniQFN-16 lead package of 2.6 mm x 1.8 mm x 0.55 mm.

This product has been qualified to the Automotive Electronics Council (AEC) standard Q100 (Grade 1) and is suitable for use in automotive applications.

#### **FEATURES**

- 1.8 V to 5.5 V single supply operation
- Low resistance: 0.37 Ω/typ. at 2.7 V
- Highly flat and matched R<sub>ON</sub>
- Low parasitic capacitance,
- C<sub>ON</sub> = 26 pF, C<sub>OFF</sub> = 14.5 pF
- High bandwidth: 338 MHz
- 0.1 ns/typ. propagation delay for rail to rail fast edge pulsing signal
- Guaranteed logic high 1.2 V, logic low 0.3 V
- · Break before make switching
- Signal swing over V+ capable
- Power down protection
- Latch up current: 300 mA (JESD78)
- · Material categorization: for definitions of compliance please see www.vishay.com/doc?99912

#### **BENEFITS**

- Low and flat resistance
- High bandwidth
- Low parasitic capacitance
- Fault protection

#### APPLICATIONS

- Automotive infotainment
- · Audio, video, and bus routing
- Industrial automation
- Medical imaging
- Network and telecommunication

Package solder reflow conditions <sup>d</sup>	miniQFN-16		250	C
Power dissipation (packages) <sup>b</sup>	miniQFN-16 °		525	mW
Latch-up, per AEC Q100-004			300	mA
ESD human body model, per AEC Q100-002			2000	V
ESD charged device model, per AEC Q100-011			1500	v

#### Notes

a. Signals on NC, NO, or COM, or IN exceeding V+ will be clamped by internal diodes. Limit forward diode current to maximum current ratings

b. All leads welded or soldered to PC board

c. Derate 6.6 mW/°C above 70 °C

d. Manual soldering with iron is not recommended for leadless components. The miniQFN-16 is a leadless package. The end of the lead terminal is exposed copper (not plated) as a result of the singulation process in manufacturing. A solder fillet at the exposed copper lip cannot be guaranteed and is not required to ensure adequate bottom side solder interconnection

Notes

a. Room = 25 °C, full = as determined by the operating suffix

The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet b.

c. Typical values are for design aid only, not guaranteed nor subject to production testing

d. Guarantee by design, not subjected to production test

e. V<sub>IN</sub> = input voltage to perform proper function

Crosstalk measured between channels f.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
