

# MPCS-5214 Series

SOP16, 4A Output Smart Gate Driver Optocoupler

## Description

The MPCS-5214 is an advanced 4 A output current, easy-to-use, intelligent gate driver which makes IGBT  $V_{CE}$  fault protection compact, affordable, and easy-to implement. Features such as integrated  $V_{CE}$  detection, under voltage lockout (UVLO), “soft” IGBT turn-off, isolated open collector fault feedback and active Miller clamping provide maximum design flexibility and circuit protection. The MPCS-5214 contains a LED. The LED is optically coupled to an integrated circuit with a power output stage. MPCS-5214 is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications. The voltage and current supplied by these optocouplers make them ideally suited for directly driving IGBTs with ratings up to 1200 V and 100 A. For IGBTs with higher ratings, the MPCS-5214 can be used to drive a discrete power stage which drives the IGBT gate. The MPCS-5214 has an insulation voltage of  $V_{IORM} = 1414 V_{PEAK}$ .

## Features

- 4 A maximum peak output current
- 250 ns maximum propagation delay over temperature range
- 1.7A Active Miller Clamp. Clamp pin short to  $V_{EE}$  if not in used
- Miller Clamping
- Desaturation Detection
- Under Voltage Lock-Out Protection (UVLO) with Hysteresis
- “Soft” IGBT Turn-off

## SCHEMATIC

## PIN DEFINITION

1. $V_S$	16. $V_E$
2. $V_{CC1}$	15. $V_{LED}$
3. FAULT	14. DESAT
4. $V_S$	13. $V_{CC2}$
5. CATHODE	12. $V_{EE}$
6. ANODE	11. $V_{OUT}$
7. ANODE	10. $V_{CLAMP}$
8. CATHODE	9. $V_{EE}$

## PACKAGE OUTLINE

# MPCS-5214 Series

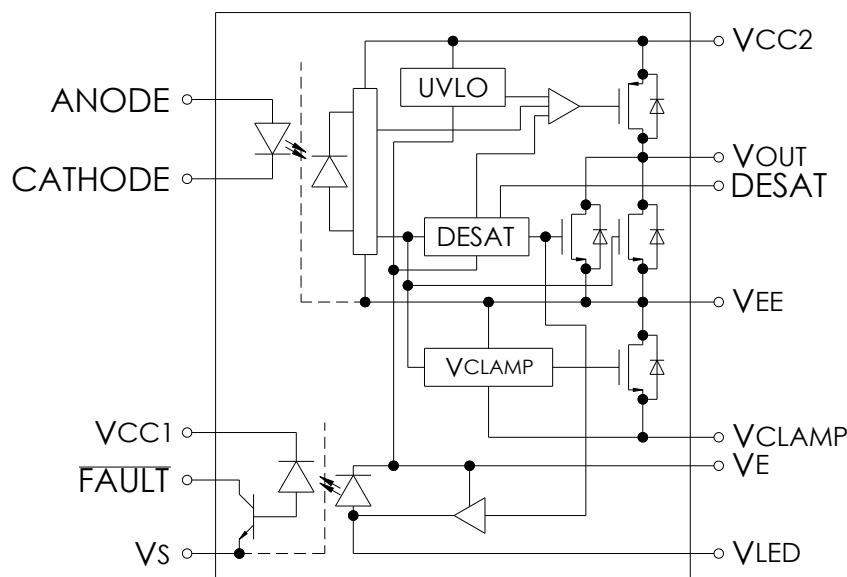

## SOP16, 4A Output Smart Gate Driver Optocoupler

- Fault Reset by next LED turn-on (low to high) after fault mute period
- Available in SO-16 package
- 100 ns maximum pulse width distortion (PWD)
- 50 kV/μs minimum common mode rejection (CMR) at  $V_{CM} = 1500$  V
- $I_{CC(max)} < 5$  mA maximum supply current
- Wide  $V_{CC}$  operating range: 15 V to 30 V over temperature range
- Wide operating temperature range:  $-40^{\circ}\text{C}$  to  $110^{\circ}\text{C}$
- Regulatory Approvals
  - UL - UL1577
  - VDE - EN60747-5-5(VDE0884-5)
  - CQC – GB4943.1, GB8898

### Applications

- Isolated IGBT/Power MOSFET gate drive
- AC and brushless DC motor drives
- Industrial inverters and Uninterruptible Power Supply(UPS)

### Internal Circuit

# MPCS-5214 Series

## SOP16, 4A Output Smart Gate Driver Optocoupler

### ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	MIN.	MAX.	UNIT	NOTE
Storage Temperature	$T_{stg}$	-55	125	°C

Unless otherwise noted, all typical values at T<sub>A</sub> = 25°C, V<sub>CC2</sub> - V<sub>EE</sub> = 30 V, V<sub>E</sub> - V<sub>EE</sub> = 0 V; all Minimum/Maximum specifications are at Recommended Operating Conditions.

### ISOLATION CHARACTERISTIC

PARAMETER	SYMBOL	MIN.	TYP.	MAX.	UNIT	TEST CONDITION	NOTE
Withstand Insulation Test Voltage	V <sub>ISO</sub>	5000	-	-	V	RH ≤ 40%-60%, t = 1min, T <sub>A</sub> = 25 °C	24,25
Input-Output Resistance	R <sub>I-O</sub>	-	10 <sup>12</sup>	-	Ω	V <sub>I-O</sub> = 500V DC	25

Note1: Derate linearly above 70°C free air temperature at a rate of 0.3 mA/°C.

Note2: In order to achieve the absolute maximum power dissipation specified, pins 4, 9, and 10 require ground plane connections and may require airflow. See the Thermal Model section in the application notes at the end of this data sheet for details on how to estimate junction temperature and power dissipation. In most cases the absolute maximum output IC junction temperature is the limiting factor. The actual power dissipation achievable will depend on the application environment (PCB Layout, air flow, part placement, etc.). See the Recommended PCB Layout section in the application notes for layout considerations. Output IC power dissipation is derated linearly at 10 mW/°C above 90°C. Input IC power dissipation does not require derating.

Note3: Maximum pulse width = 10 μs. This value is intended to allow for component tolerances for designs with IO peak minimum = 1.0 A. Derate linearly from 2.0 A at +25°C to 1.5 A at +105°C. This compensates for increased I<sub>OPEAK</sub> due to changes in V<sub>OL</sub> over temperature.

Note4: This supply is optional. Required only when negative gate drive is implemented.

Note5: Maximum pulse width = 50 μs.

Note6: See the Slow IGBT Gate Discharge During Fault Condition section in the applications notes at the end of this data sheet for further details.

# MPCS-5214 Series

## SOP16, 4A Output Smart Gate Driver Optocoupler

Note7: 15 V is the recommended minimum operating positive supply voltage ( $V_{CC2} - V_E$ ) to ensure adequate margin in excess of the maximum  $V_{UVLO+}$  threshold of 12.5 V. For High Level Output Voltage testing,  $V_{OH}$  is measured with a dc load current. When driving capacitive loads,  $V_{OH}$  will approach  $V_{CC}$  as  $I_{OH}$  approaches zero units.

Note8: Maximum pulse width = 1.0 ms.

Note9: Once  $V_O$  of the MPCS-5214 is allowed to go high ( $V_{CC2} - V_E > V_{UVLO+}$ ), the DESAT detection feature of the MPCS-5214 will be the primary source of IGBT protection.  $U_{VLO}$  is needed to ensure DESAT is functional. Once  $V_{CC2}$  is increased from 0V to above  $V_{UVLO+}$ , DESAT will remain functional until  $V_{CC2}$  is decreased below  $V_{UVLO-}$ . Thus, the DESAT detection and  $U_{VLO}$  features of the MPCS-5214 work in conjunction to ensure constant IGBT protection.

Note10: See the DESAT fault detection blanking time section in the applications notes at the end of this data sheet for further details.

Note11: This is the “increasing” (i.e. turn-on or “positive going” direction) of  $V_{CC2} - V_E$

Note12: This is the “decreasing” (i.e. turn-off or “negative going” direction) of  $V_{CC2} - V_E$

Note13: This load condition approximates the gate load of a 1200 V/75A IGBT.

Note14: Pulse Width Distortion (PWD) is defined as  $|t_{PHL} - t_{PLH}|$  for any given unit.

Note15: As measured from  $I_F$  to  $V_O$ .

Note16: The difference between  $t_{PHL}$  and  $t_{PLH}$  between any two MPCS-5214 parts under the same test conditions.

Note17: As measured from ANODE, CATHODE of LED to  $V_{OUT}$ .

Note18: This is the amount of time from when the DESAT threshold is exceeded, until the FAULT output goes low.

Note19: This is the amount of time the DESAT threshold must be exceeded before  $V_{OUT}$  begins to go low, and the FAULT output to go low. This is supply voltage dependent.

Note20: Auto Reset: This is the amount of time when  $V_{OUT}$  will be asserted low after DESAT threshold is exceeded. See the Description of Operation (Auto Reset) topic in the application information section.

Note21: Common mode transient immunity in the high state is the maximum tolerable  $dV_{CM}/dt$  of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in the high state (i.e.,  $V_O > 15$  V or FAULT  $> 2$  V).

Note22: Common mode transient immunity in the low state is the maximum tolerable  $dV_{CM}/dt$  of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a low state (i.e.,  $V_O < 1.0$  V or FAULT  $< 0.8$  V).

Note23: To clamp the output voltage at  $V_{CC} - 3 V_{BE}$ , a pull-down resistor between the output and VEE is recommended to sink a static current of 650  $\mu$ A while the output is high. See the Output Pull-Down Resistor section in the application notes at the end of this data sheet if an output pull-down resistor is not used.

# ***MPCS-5214 Series***

## ***SOP16, 4A Output Smart Gate Driver Optocoupler***

Note24: In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage  $\geq 6000$  Vrms for 1 second. This test is performed before the 100% production test for partial discharge (method b) shown in IEC/EN/DIN EN 60747-5-5 Insulation Characteristic Table.

Note25: This is a two-terminal measurement: pins 1-8 are shorted together and pins 9-16 are shorted together.

Note26: Split resistors network with a ratio of 1:1 is needed at input LED1.

## TEMPERATURE PROFILE OF SOLDERING

### WAVE SOLDERING (JESD22-A111 COMPLIANT)

### HAND SOLDERING BY SOLDERING IRON

Soldering Temperature	380+0/-5°C
Soldering Time	3 sec max.

One time soldering is recommended for all soldering method.

Do not solder more than three times for IR reflow soldering.

- The characteristic curves shown in this datasheet are representing typical performance which are not guaranteed.
- WISELITE makes no warranty, representation or guarantee regarding the suitability of the products for any particular purpose or the continuing production of any product. To the maximum extent permitted by applicable law, WISELITE disclaims (a) any and all liability arising out of the application or use of any product, (b) any and all liability, including without limitation special, consequential or incidental damages, and (c) any and all implied warranties, including warranties of fitness for particular.
- The products shown in this publication are designed for the general use in electronic applications such as office automation, equipment, communications devices, audio/visual equipment, electrical application and instrumentation purpose, non-infringement and merchantability.
- This product is not intended to be used for military, aircraft, medical, life sustaining or lifesaving applications or any other application which can result in human injury or death.
- Please contact WISELITE sales agent for special application request.
- Immerge unit's body in solder paste is not recommended.
- Parameters provided in datasheets may vary in different applications and performance may vary over time. All operating parameters, including typical parameters, must be validated in each customer application by the customer's technical experts. Product specifications do not expand or otherwise modify WISELITE's terms and conditions of purchase, including but not limited to the warranty expressed therein.
- Discoloration might be occurred on the package surface after soldering, reflow or long-time use. It neither impacts the performance nor reliability.
