1. Scope

The SCC series is safety capacitors are designed specifically for use Information Technology Equipment.

Including Electrical Business Equipment –Component.

These parts are compliant to UL60950-1 / CSA C22.2 No.60950-1-07 standards.

These capacitors are available in C0G (NPO) and X7R dielectrics. **(This product compliant with the RoHS & HF and Pb free.)**

Caution

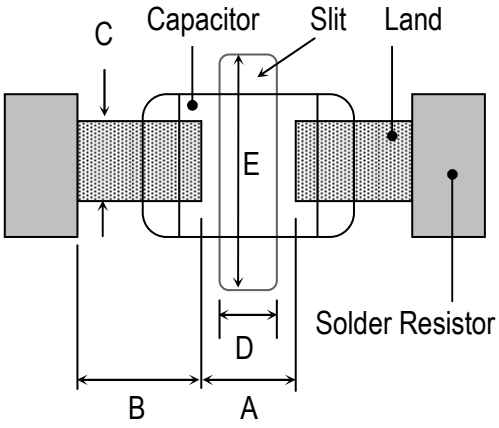
1. Storage

Store the capacitors where the temperature and relative humidity don't exceed 40℃ and 70%RH. We recommend that the capacitors be used within 12 months from the date of manufacturing. Store the products in the original package and do not open the outer wrapped, polyethylene bag, till just before usage. If it is open, seal it as soon as possible or keep it in a desiccant with a desiccation agent.

2. Construction of Board Pattern

Improper circuit layout and pad/land size may cause excessive or not enough solder amount on the PC board. Not enough solder may create weak joint, and excessive solder may increase the potential of mechanical or thermal cracks on the ceramic capacitor. Therefore we recommend the land size to be as shown in the following table:

2.1 Size and recommend land dimensions for reflow soldering.



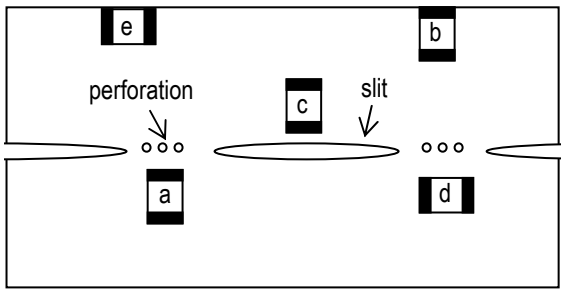
EIA Code	Chip (mm)		Land (mm)				
	L	W	A	B	C	D	E
1808	4.60	2.00	2.8~3.4	1.2~1.4	1.5~1.8	1.0~2.8	3.6~4.1
1812	4.60	3.20	2.8~3.4	1.2~1.4	2.3~3.0	1.0~2.8	4.8~5.3
2208	5.70	2.00	4.0~4.6	1.4~1.6	1.5~1.8	1.0~4.0	3.6~4.1
2211	5.70	2.80	4.0~4.6	1.4~1.6	2.0~2.6	1.0~4.0	4.4~4.9
2220	5.70	5.00	4.0~4.6	1.4~1.6	3.5~4.8	1.0~4.0	6.6~7.1

2.2 Mechanical strength varies according to location of chip capacitors on the P.C. board.

Design layout of components on the PC board such a way to minimize the stress imposed on the components, upon flexure of the boards in depanelization or other processes.

Component layout close to the edge of the board or the "depanelization line" is not recommended.

Susceptibility to stress is in the order of: a>b>c and d>e



2.3 Layout Recommendation

Example	Use of Common Solder Land	Solder With Chassis	Use of Common Solder Land With Other SMD
Need to Avoid			Recommendation			
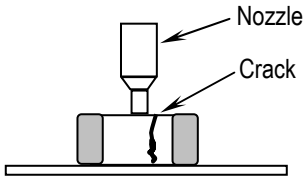
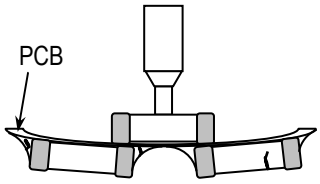
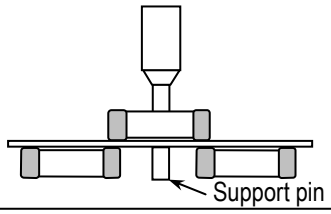
3. Mounting

3.1 Sometimes Crack is caused by the impact load due to suction nozzle in pick and place operation.

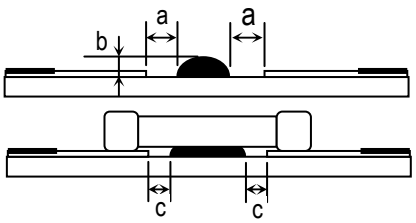
In pick and place operation, if the low dead point is too low, excessive stress is applied to component. This may cause cracks in the ceramic capacitor, therefore it is required to move low dead point of a suction nozzle to the higher level to minimize the board warp age and stress on the components. Nozzle pressure is typically adjusted to 1N to 3N (static load) during the pick and place operation.

Excessive Stress	Warping of Board	Warping of Board
		






3.2 Amount of Adhesive



Example : 0805 & 1206

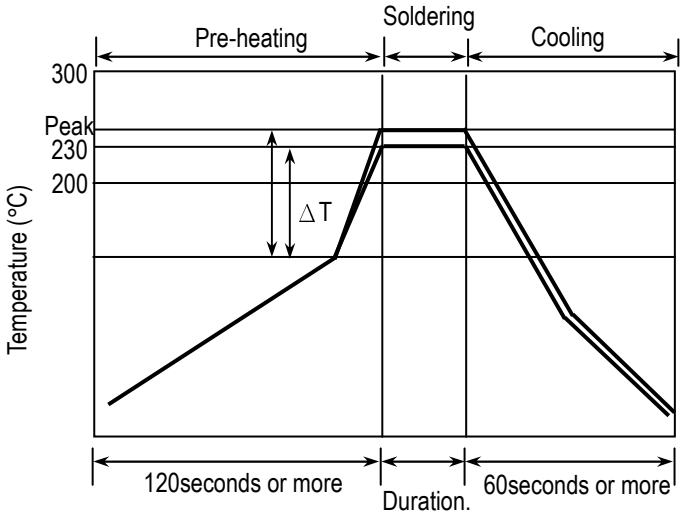
a	0.2mm min.
b	70 ~ 100 μm
c	Do not touch the solder land

4. Soldering

4.1. Wave Soldering

Most of components are wave soldered with solder at Peak Temperature.. Adequate care must be taken to prevent the potential of thermal cracks on the ceramic capacitors. Refer to the soldering methods below for optimum soldering benefits.

Recommend flow soldering temperature Profile



Soldering Method	Peak Temp.(℃) / Duration (sec)
1206 and Under	ΔT ≤ 100~130 max.
Pb-Sn Solder	250℃(max.) / 3sec(max.)
Lead Free Solder	260℃(max.) / 5sec(max.)

Recommended solder compositions

Sn-37Pb (Pb - Sn Solder)

Sn-3.0Ag-0.5Cu (Lead Free Solder)

To optimize the result of soldering, proper preheating is essential:

1) Preheat temperature is too low
   a. Flux flows to easily
   b. Possibility of thermal cracks
2) Preheat temperature is too high
   a. Flux deteriorates even when oxide film is removed
   b. Causes warping of circuit board
   c. Loss of reliability in chip and other components

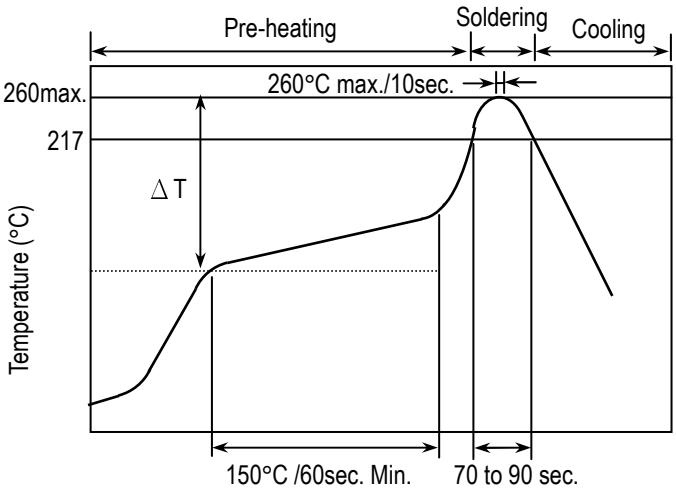
Cooling Condition:

Natural cooling using air is recommended. If the chips are dipped into a solvent for cleaning, the temperature difference (ΔT) between the solvent and the chips must be less than 100℃.

4.2 Reflow Soldering

Preheat and gradual increase in temperature to the reflow temperature is recommended to decrease the potential of thermal crack on the components. The recommended heating rate depends on the size of component, however it should not exceed 3℃/Sec.

Recommend reflow profile for Lead-Free soldering temperature Profile (MIL-STD-202G #210F)

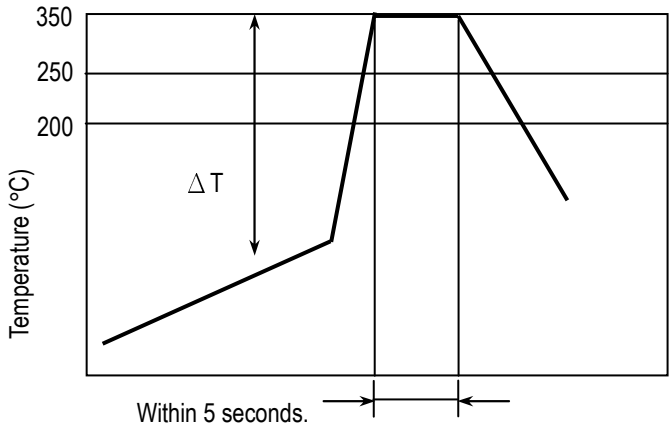


※ The cycles of soldering : Twice (max.)

Soldering Method	Change in Temp.(℃)
1206 and Under	ΔT ≦ 190 ℃
1210 and Over	ΔT ≦ 130 ℃

4.3 Hand Soldering

Sudden heating of the components results in distortion due to a high internal temperature differential, causing cracked chips. When preheating, keep temperature differential ΔT, within the range shown in table. The smaller the ΔT, the less stress on the chip.



Soldering Method	Change in Temp.(℃)
1206 and Under	ΔT ≦ 150 ℃
1210 and Over	ΔT ≦ 130 ℃

How to Solder Repair by Solder Iron

1) Selection of the soldering iron tip

Tip temperature of solder iron various by its type , P.C.board material and solder land size. Higher the tip temperature, quick the operation is .but the heat shock may crack the chip capacitor.

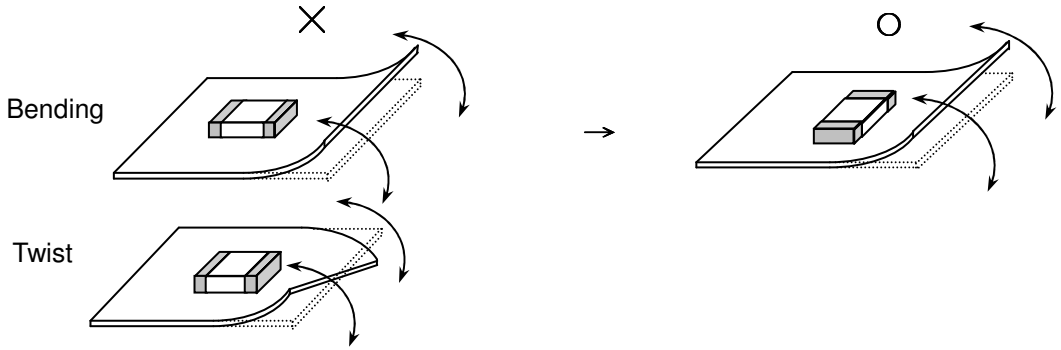
2) recommended solder iron condition

a.) Preheating Condition：Board and components should be preheated sufficiently at 150℃ or over, and soldering should be conducted with soldering iron as boards and components are maintained at sufficient temperatures.
b.) Soldering iron power shall not exceed 30 W.
c.) Soldering iron tip diameter shall not exceed 3mm.
d.) Temperature of iron tip shall not exceed 350℃ and the process should be finished within 5 seconds. (refer to MIL-STD-202G)
e.) Do not touch the ceramic dielectric with solder iron other than the terminations. Direct contact of the soldering iron with ceramic dielectric of chip capacitor may cause crack.
f.) After soldering ,let the products to cool down gradually in the room temperature.

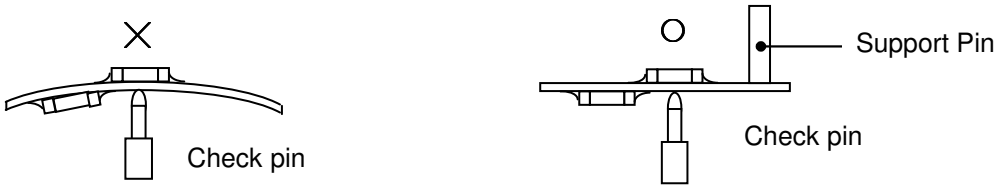
※ **The soldering to lose the use of electronic heat gun.**

5. Handling after chip mounted

5.1 Please pay attention put the component lateral to the direction in which stress acts.



5.2 Crack will be caused if board is warped due to excessive load by check pin.



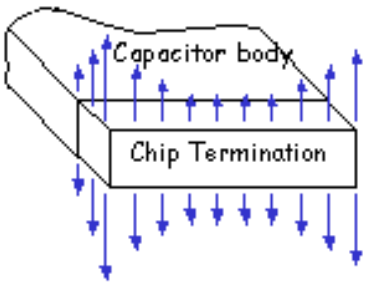
5.3 Mechanical stress due to warping and torsion by dividing.

(a) Crack occurrence ratio will be increased by manual separation.

(b) Crack occurrence ratio will be increased by tensile force , rather than compressive force.

╳ :Tensile Stress ○ :Compressive Stress

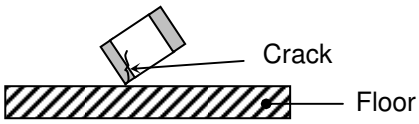
Capacitor Stress Analysis



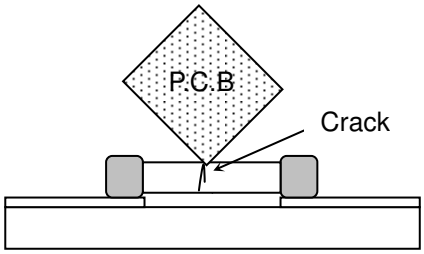
Failure mode: chip crack by stress

6. Handling of Loose Chip Capacitor

6.1 If dropped the chip capacitor may crack.



6.2 Piling the P.C. board after mounting for storage or handling, the corner of the P.C. board may hit the chip capacitor of another of board to cause crack.



7. Safekeeping condition and period

For safekeeping of the products, we recommend to keep storage temperature +5 ~+40℃ , Humidity 20 ~70%RH and use them within 12 months.
