#### DESCRIPTION

The resistors are constructed in a high grade ceramic body (aluminum oxide). Internal metal electrodes are added at each end and connected by a resistive layer that is applied to the top surface of the substrate. The composition of the resistive layer is adjusted to give the approximate resistance required and the value is trimmed to nominated value within tolerance which controlled by laser trimming of this resistive layer.

The resistive layer is covered with a protective coat. Finally, the two external end terminations are added. For environmental soldering issue, the outer layer of these end terminations is a Lead-free solder .

#### • 4-digits marking for 1206, 0805 size

Each resistor is marked with a four digits code on the protective coating to designate the nominal resistance value of E24+E96. For values below  $97\Omega6$  the R is used as a digit. For values of  $100\Omega$  or greater, the first 3 digits are significant, the fourth digit indicates the number of multiple to follow.

#### **FUNCTIONAL DESCRIPTION**

#### **Product characterization**

Standard values of nominal resistance are taken from the E24 & E96 series for resistors with a tolerance of  $\pm 1.0\%$ ,  $\pm 0.5\%$ ,  $\pm 0.25\%$ ,  $\pm 0.1\%$ . The values of the E24/E96 series are in accordance with "IEC publication 60063".

#### **Derating**

The power that the resistor can dissipate depends on the operating temperature; see Fig.2

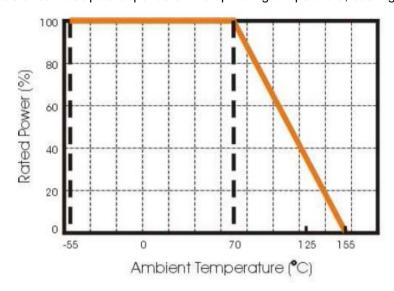

Figure 2. Maximum dissipation in percentage of rated power As a function of the ambient temperature

#### **MOUNTING**

Due to their rectangular shapes and small tolerances, Surface Mountable Resistors are suitable for handling by automatic placement systems.

Chip placement can be on ceramic substrates and printed-circuit boards (PCBs).

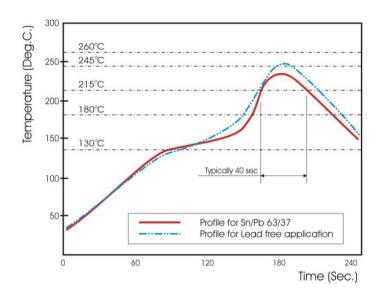

Electrical connection to the circuit is by individual soldering condition.

The end terminations guarantee a reliable contact.

#### **SOLDERING CONDITION**

The robust construction of chip resistors allows them to be completely immersed in a solder bath of 260°C for 10 seconds. Therefore, it is possible to mount Surface Mount Resistors on one side of a PCB and other discrete components on the reverse (mixed PCBs).

Surface Mount Resistors are tested for solderability at 235°C during 2 seconds within lead-free solder bath. The test condition for no leaching is 260°C for 30 seconds. Typical examples of soldering processes that provide reliable joints without any damage are given in Fig 3.

#### **CATALOGUE NUMBERS**

The resistors have a catalogue number starting with .
